A descriptive analysis of service-users attending an outpatient treatment centre during 2007 - 2010

Kevin D Murphy1, Stephen Byrne1, Sharon Lambert2, and Laura Sahm1.
1Pharmaceutical Care Research Group, University College Cork, Ireland 2Matt Talbot Services, Cork, Ireland

Background:
- More than a quarter (27.3%) of 15-24 year-olds in Ireland experimented with illegal substances in their lives.
- Nearly 1-in-12 (8.2%) drug treatment cases was to a service-user under 18 years of age.
- Approximately 1-in-7 (14.8%) deaths due to drugs occurred in under-25s.
- Matt Talbot Services (MTS) is a day treatment service for young substance-users within Cork/Kerry area of Ireland.
- They provide a specialised, individualised counselling service for 14 – 23 year olds, and an after-care service to reduce the incidence of relapse.
- This exploratory work will serve as a base for future pharmaceutical care interventions and research on adolescent use of illegal and prescription substances.

Aims:
The aims were as follows:
1. Analyse demographic information on service-users attending MTS between 2007 and 2010.
2. Describe the type and nature of substance use among service-users.
3. Perform inferential statistics to detect patterns in service-user behaviour.

Method:
- Data from the records of entrants to the service between 2007 and 2010 (n=291) was collected and included:
  - Demographic data
  - Educational and employment history
  - Substance use history
  - Treatment details
- Data was analysed using Predictive Analytics SoftWare Statistics (PASW; SPSS Inc. Chicago, Ill.) version 18.0.
- Descriptive analysis was performed on the data. Inferential tests measuring for association were also performed.

Results:
Results of the analysis of service-user demographics and substance history can be seen in Table 1, and Figures 1 and 2.

Conclusions:
- Substance use by adolescents in the Cork/Kerry area is a serious issue.
- Pharmacists possess the ideal background and knowledge to develop interventions which will form part of a substance withdrawal algorithm in the wider challenge of service-user rehabilitation.
- Recognition of the problem and establishing the level of substance use is the first step towards meaningful resolution which will require all stakeholders’ input.

Limitations:
- Tobacco use was not surveyed; it is often the 1st substance to be experimented with.
- Study was based on self-reported data; patients may not remember details of past use accurately.

Acknowledgements:
We would like to thank all the staff of Matt Talbot Services for the cooperation they provided us throughout the duration of the study.
