Appendix S1. Calculation of pre-pregnancy body mass index specific gestational weight gain z-scores

We constructed gestational weight gain reference charts for underweight, normal weight, overweight, and grade 1, 2 and 3 obese women using individual participant data from 218,216 pregnant women participating in 33 pregnancy cohort studies from Europe, North America and Oceania. Of these women, 9,065 (4.2%), 148,697 (68.1%), 42,678 (19.6%), 13,084 (6.0%), 3,597 (1.6%), and 1,095 (0.5%) were underweight, normal weight, overweight, and grade 1, 2 and 3 obese women, respectively. We fitted the models, separately for each maternal pre-pregnancy BMI group, by the Box-Cox t (BCT) method using the generalized additive model for location, scale and shape package in R version 3.3.1.^{1,2} The parameters of this BCT model at a certain gestational age were used to allow the calculation of maternal pre-pregnancy body mass index specific weight gain for gestational age z-scores.
