sFigure 1. 5-HT$_{2C}$ receptor transcript variants in the prefrontal cortex. The prefrontal cortex of mice with a conventional microbiota (CON), mice without a microbiota (GF) and mice of which the microbiota was colonized (CGF), were investigated using RNA sequencing, after which the relative frequency of 5-HT2C receptor transcript variants was assessed. Notably, the 5-HT$_{2C}$ receptor is not as highly expressed in the prefrontal cortex as the amygdala. As such, the sequencing depth of the 5-HT$_{2C}$ receptor and its isoforms was not as high, and these findings need to be interpreted with care. Only transcript variants are depicted of which relative frequency was higher than 1%. All data are expressed as mean ± SEM (n = 3-4).

sTable 1. Relative occurrence of 5-HT₂C isoforms compared to previous work investigating 5-HT₂C editing in the hypothalamus of C57Bl/6 mice showing similar editing patterns (Schellekens et al. 2012).

Rank	Relative occurrence in CON, Amygdala, Swiss-Webster	Edited sites / Isoform	Sequence of edited cassette as seen in RNA-seq data	% Relative occurence Schellekens et al. 2012
