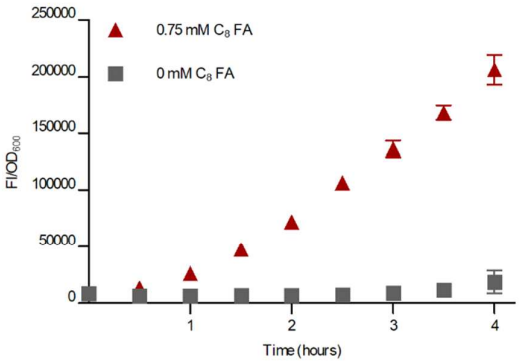

Figure S1. Time-dependent response of the biosensor in SCD medium with and without C_8 fatty acids. Relative fluorescence intensity (fluorescence intensity (FI) divided by OD_{600}) of the plasmid-based sensor in response to 0 (grey squares) and 0.75 mM (red triangles) C_8 fatty acids (FA), respectively. The background fluorescence of the biosensor strain not exposed to C_8 FA is very low over the entire time course. Error bars represent two technical replicates.

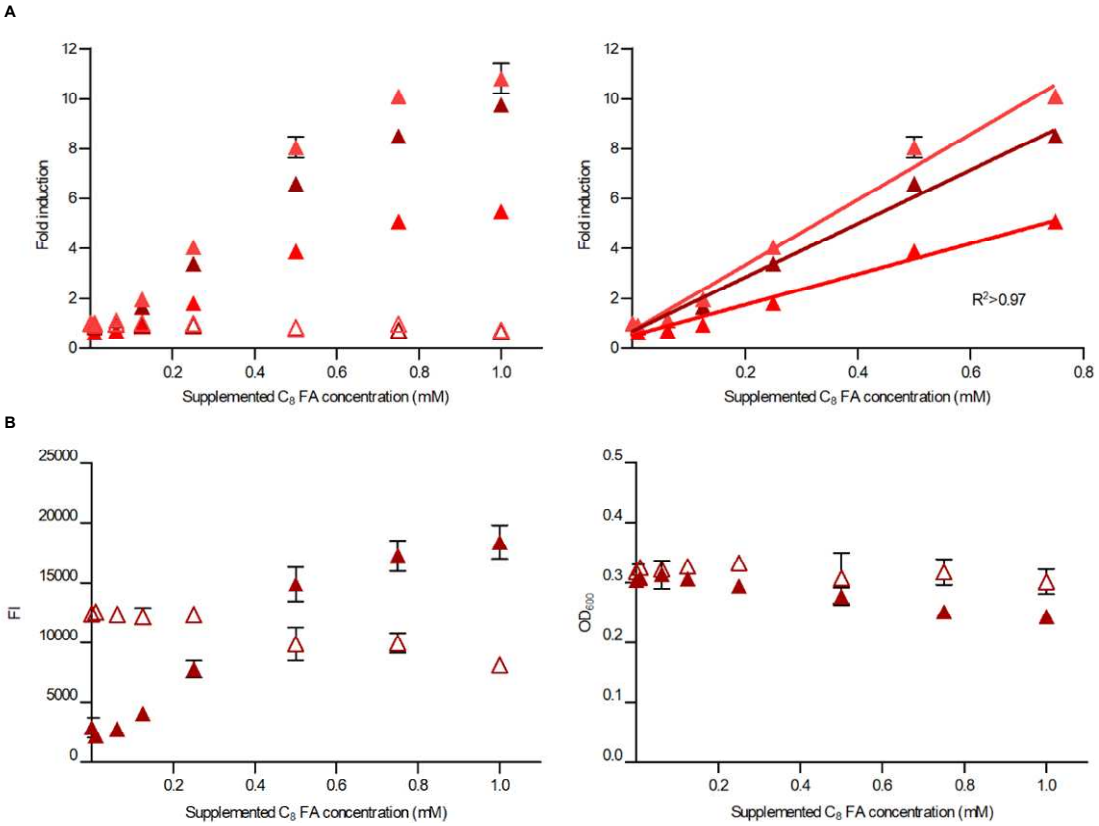

Figure S2. C_8 fatty acid-dependent response of the biosensor in SCD medium. (A) Response (left) and linear range (right) of the biosensor after 2 hours incubation with supplemented C_8 fatty acids (FA) in SCD medium. Shown are three biological replicates with two technical replicates each. For fold induction values, fluorescence intensities (FI) were divided by optical densities (OD_{600}) and normalized to FI/OD_{600} values of samples without C_8 FA. (B) FI (left) and OD_{600} (right) of all three biological replicates. Filled triangles: CEN.PK113-11C + p426pPDR12-GFP. Clear triangles: CEN.PK113-11C + p426pMET25-GFP.

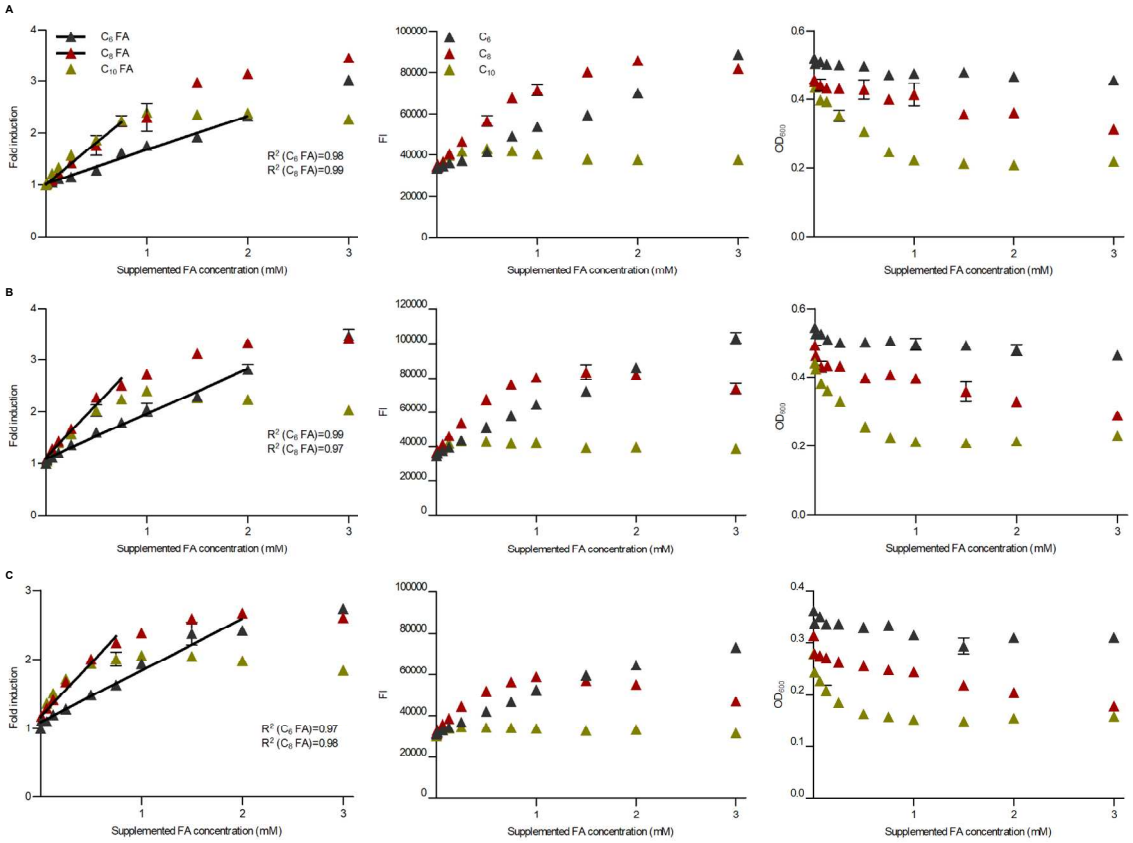

Figure S3. C_6, C_8 and C_{10} fatty acid-dependent response of the biosensor in YPD medium of three biological replicates (A, B, C). Response and linear range (left), fluorescence intensities (FI; middle) and optical densities (OD_{600}; right) after 4 hours incubation with supplemented C_6, C_8 or C_{10} fatty acids (FA) of all three biological replicates. Linear ranges were only observed in response to C_6 and C_8 FAs (left). Error bars represent two technical replicates. For fold induction values, FIs were divided by OD_{600} values and normalized to FI/OD_{600} values of samples without FA.

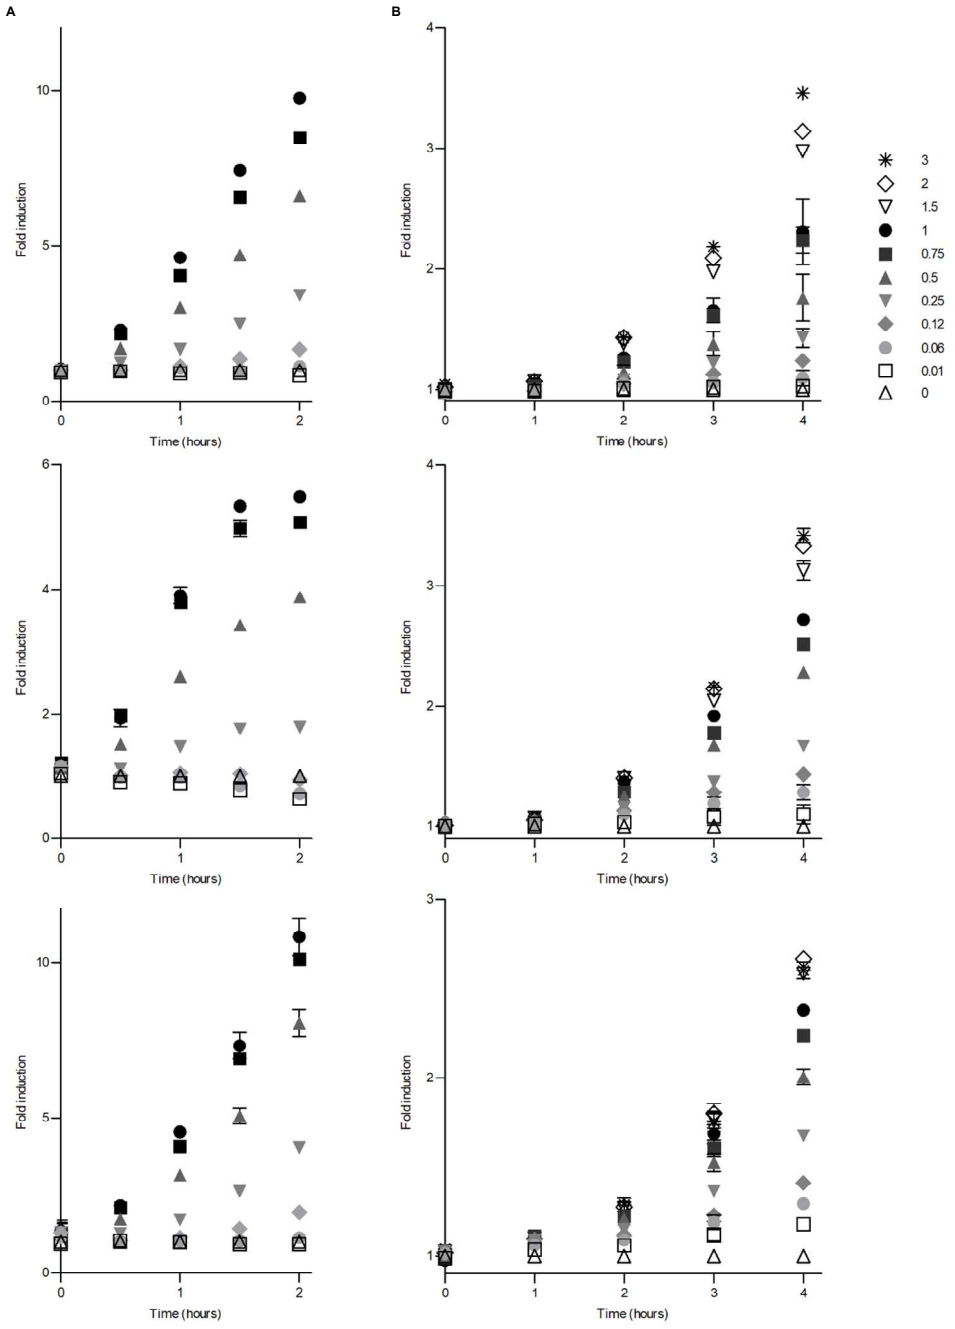

Figure S4. Time-dependent response of the biosensor to different C_8 fatty acid concentrations. Response over a 2 hour incubation period to supplemented 0-1 mM C_8 fatty acids (FA) in SCD (A) and over a 4 hour incubation period to supplemented 0-3 mM C_8 FA in YPD medium (B) of three biological replicates. Error bars represent two technical replicates. For fold induction values, fluorescence intensities (FI) were divided by optical densities (OD_{600}) and normalized to FI/OD_{600} values of samples without C_8 FA (0 mM).

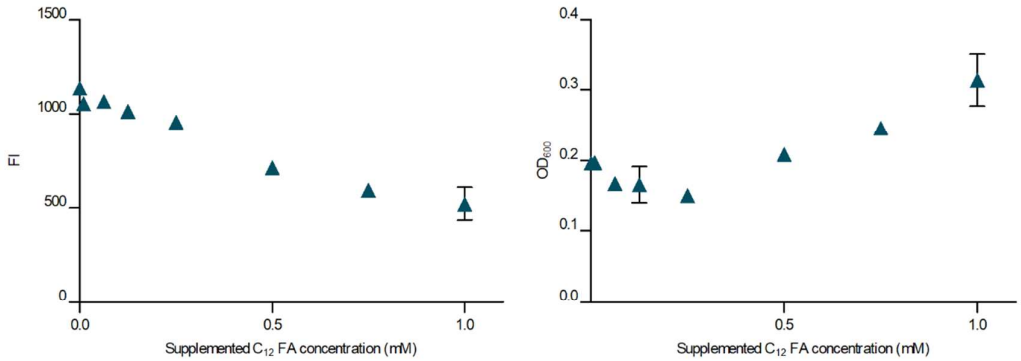

Figure S5. C_{12} fatty acid-dependent growth and fluorescence of the biosensor. Fluorescence intensities (FI; left) and optical densities (OD_{600}; right) in response to supplementation with C_{12} fatty acids (FA) after 4 hours incubation in YPD medium. Error bars represent two technical replicates.

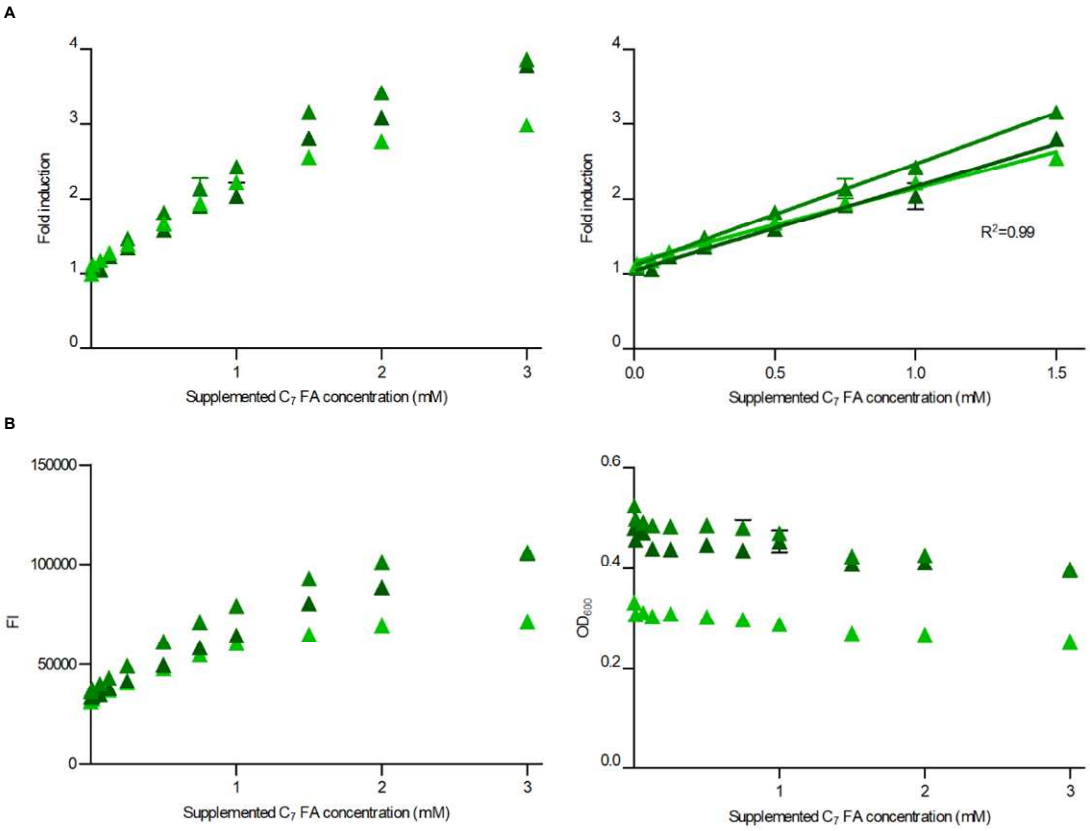

Figure S6. C_7 fatty acid-dependent response of the biosensor. (A) Response (left) and linear range (right) of the biosensor after 4 hours incubation with supplemented C_7 fatty acids (FA) in YPD medium. For fold induction values, fluorescence intensities (FI) were divided by optical densities (OD_{600}) and normalized to FI/OD_{600} values of samples without C_7 FA. (B) FI (left) and OD_{600} (right) values of all three biological replicates. Shown are three biological replicates with error bars representing two technical replicates.

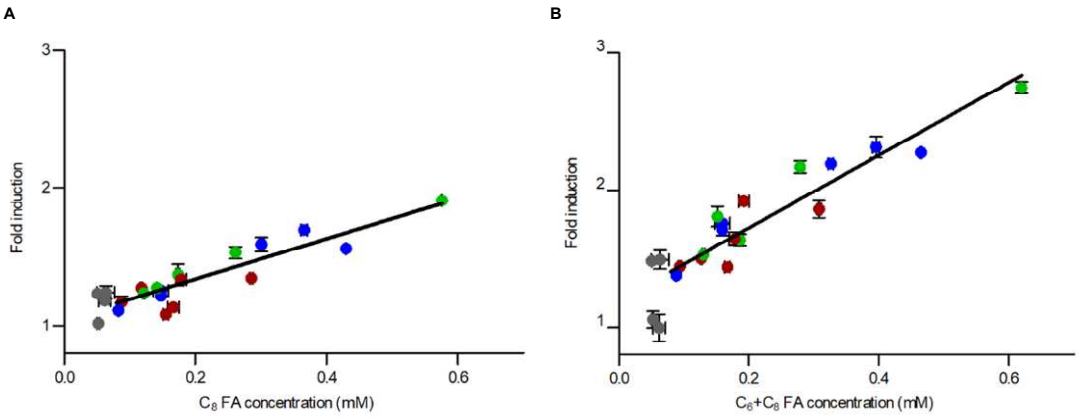

Figure S7. Biosensor response to fatty acids in *S. cerevisiae* culture supernatants and correlation to GC measurement. (A) Linear correlation of the fold induction of biosensor signal in 0.25 dilutions of culture supernatants with GC measurements of C_8 fatty acids (FA) of the same supernatants. (B) Linear correlation of the fold induction of biosensor signal in 0.5 dilutions of culture supernatants with GC measurements of C_6 and C_8 FA of the same supernatants. Strains: CEN.PK113-7D (grey), RPY21/FAS^{R1834K}/ pRS42H (red), RPY21/FAS^{R1834K}/ LBV17 (blue), RPY21/FAS^{R1834K}/ LBV20 (green).
