Supplementary Figure S1. ErbB2 activity was highest out of 39 receptor tyrosine kinases assessed in the rd10 retina. (A) Use of a receptor tyrosine kinase activity array with P50 retinal

lysates from untreated and Norgestrel-treated rd10 mice revealed the highest level of immunoreactivity for ErbB2. Each antibody is spotted in duplicate. An increase in ErbB2 activity was observed with Norgestrel (coordinates B3, B4). **(B)** A detailed description of the antibodies present on the array and their coordinates.
