Title	ASXL gain-of-function truncation mutants: defective and dysregulated forms of a natural ribosomal frameshifting product?
Authors	Dinan, Adam M.;Atkins, John F.;Firth, Andrew E.
Publication date	2017-10-16
Original Citation	Dinan, A. M., Atkins, J. F. and Firth, A. E. (2017) 'ASXL gain-of-function truncation mutants: defective and dysregulated forms of a natural ribosomal frameshifting product?', Biology Direct, 12, 24 (16pp). doi: 10.1186/s13062-017-0195-0

Supplementary Figure 1. Amino acid sequences of human ASXL and ASXL-TF polypeptides.

Supplementary Figure 2. Synonymous site conservation in the *ASXL1* and *ASXL2* coding regions in different vertebrate clades. In each subfigure, the top panel shows a schematic of the zero-frame ORF (pale blue) and the overlapping *TF* ORF (pink). The next two panels show positions of stop codons (blue) in the +1 and +2 reading frames, and alignment gaps (grey) in each

sequence of the sequence alignment. The vertical green line in the +1 frame panel shows the position of the putative frameshift site. The bottom two panels show the synonymous site conservation analysis, with the magenta line (lower panel) indicating the ratio of the observed number of substitutions within a given window to the number expected under a null model of neutral evolution at synonymous sites, and the red line (upper panel) showing the corresponding *p*-value. The analysis uses a 25-codon sliding window. The horizontal dashed grey line indicates a $p = 0.05$ threshold after a correction for multiple testing (namely scaling by [25-codon window size]/ [*ASXL* CDS length].

Supplementary Figure 3. Synonymous site conservation in the *ASXL1* and *ASXL2* coding regions in different vertebrate clades. In each subfigure, the top panel shows a schematic of the zero-frame ORF (pale blue) and the overlapping *TF* ORF (pink). The bottom two panels show the synonymous site conservation analysis, with the magenta line (lower panel) indicating the ratio of the observed number of substitutions within a given window to the number expected under a null model of neutral evolution at synonymous sites, and the red line (upper panel) showing the corresponding *p*-value. The analysis uses a 9-codon sliding window. The horizontal dashed grey line indicates a $p = 0.05$ threshold after a correction for multiple testing (namely scaling by [9-codon window size]/[*ASXL* CDS length]. The vertical green and blue lines show the positions of the putative frameshift site and the conserved EH[N/S]Y, respectively.

Human *ASXL1* (GenBank accession NM_015338) - *TF* ORF region

UXX	Last upstream *TF*-frame stop codon
UXX	*TF* ORF stop codon
XXX	Putative frameshift site
AUG	*TF*-frame AUGs (none in *ASXL2*)

Supplementary Figure 4. Nucleotide sequences of the human *TF* ORF regions. Nucleotide sequences are shown for the region between the last upstream in-frame stop codon (orange) and the *TF* ORF stop codon (red); however ribosomes are expected to enter the *TF* frame at the putative frameshift sites (purple). Zero-frame codons are separated by spaces. The absence of *TF*-frame AUG codons in the *TF* region in *ASXL2* and except near the 3′ end of the *TF* ORF in *ASXL1*, argues against independent internal initiation in *TF*.

Supplementary Figure 5. Predicted ordered and disordered regions in human ASXL and ASXL-TF polypeptides. The TF region is highlighted in yellow.

Supplementary Figure 6. Ribosome profiling analysis of human *ASXL*. Transcript maps of *ASXL1* (left) and *ASXL2* (right) are shown at top, with the main *ASXL* ORF in pale blue and the overlapping *TF* ORF in pink. Below, the first two tracks (red) show ribosome profiling from Jurkat T-lymphocyte cells and MDA-MB-231 breast cancer cells. The bottom track (purple) shows RNASeq from MDA-MB-231 breast cancer cells. Plots show histograms of the 5′ ends of reads with a +12 nt offset to map (for ribosome profiling) approximate P-site positions, and smoothed with a 31-nt running mean filter. The y-axis shows the mean read counts after smoothing. The inset plot (turquoise) shows the ratio, within the coding sequence, of the two ribosome profiling datasets after first applying a 61-nt running mean filter to each dataset. Note that the high levels of ribosome drop-off seen in *ASXL1* in Jurkat cells is likely to be a result of suspected somatic mutations in this cell-line rather than highly efficient ribosomal frameshifting (see text).

Supplementary File 1 - accession numbers of sequences used

The subsets of sequences (76 for *ASXL1* and 52 for *ASXL2*) selected to more uniformly cover the phylogeny for the sequence logo analyses are indicated with asterisks.

Supplementary File 2 - vertebrate *ASXL1* and *ASXL2* TF peptide sequences

ASXL1

Predicted ASXL1 TF peptide sequences following a +1 PRF at the conserved UCC_UUU_CGU sequence. The conserved EH[N/S]Y motif is highlighted in purple.
