In model studies towards the synthesis of harringtonolide, the construction of the tropone moiety via arene cyclopropanation was investigated. The installation of the lactone ring was accomplished by way of a Diels-Alder cycloaddition of various indenones and α -pyones. The incorporation of the key bridge methyl group and subsequent control of its stereochemistry is also outlined.

Introduction

The diterpenoid tropone, harringtonolide (3), was first isolated in North America from the seeds of *Cephalotaxus harringtonia* (Taxaceae) and its structure established by X-ray 15 crystallography (Scheme 1). It was also isolated in China from *C. hainanensis*^{2, 3} and found to have both anti-neoplastic and anti-viral properties, being active against Lewis Lung carcinoma, Walker carcinoma, Sarcoma-180, and L-1210, L-615 and P-388 leukaemias, as well as showing *in vitro* activity 20 against influenza type A, Newcastle disease, Japanese B encephalitis and vaccinia viruses. Harringtonolide is a structurally rigid and congested molecule, consisting of seven adjacent stereocenters. Of particular interest is the presence of the cycloheptatrienone, or tropone, substructure since it is 25 believed that this functionality is responsible for the biological activity of the compound.

Scheme 1 Previous synthesis of harringtonolide.

While we have previously reported the successful synthesis of harringtonolide by way of an arene-cyclopropanation strategy, the approach had some inherent drawbacks.⁵⁻⁷ In particular, the relatively early formation of the reactive cycloheptatriene moiety and the need to carry out extensive manipulations in its presence had a deleterious impact on yields. It was clear form these difficulties that an improved route to harringtonolide was required. In this new scheme, the cyclopropanation-tautomerisation process would be effected 40 at a much later stage so that fewer subsequent steps would be required. It was proposed that the lactone function be installed by means of a Diels-Alder cycloaddition reaction, while the ether ring would be established using cyclopropyl ringopening chemistry (Scheme 2). The bulk of the 45 harringtonolide skeleton would thus be in place prior to installation of the cycloheptatriene motif. While the initial [4+2] cycloaddition between the indenone and the pyrone was likely to be problematical, the intramolecular cyclopropanation of the aromatic ring was of greater concern. 50 This crucial step was not expected to be as favourable as the conversion of 1 to 2 in the previous total synthesis, given the different ring sizes and the potential for competing reactions, such as CH insertion at the benzylic position and/or ylide formation with the lactone carbonyl group.

eme 2 Proposed route to harringtonolide.

Results and discussion

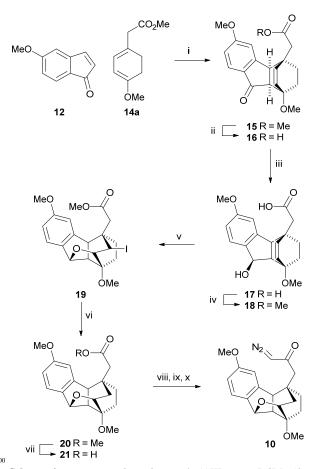

In order to study this key synthetic step and other aspects of the proposed route to harringtonolide, a series of model studies was initiated. From a geometrical perspective, diazoketone 10 was considered to be a good match for 7 (Figure 1). This was supported by some preliminary computational calculations in which both molecules were of overlaid for comparison purposes.

Figure 1 Molecular geometry comparison.

⁷⁰ 5-Methoxyindanone (11), ⁸ prepared in 2 steps from commercially available *m*-methoxycinnamic acid, was treated with *N*-bromosuccinimide and triethylamine to afford indenone 12 in 65% yield (Scheme 3). Birch reduction of *p*-methoxyphenylacetic acid (13) followed by acidification and ⁷⁵ esterification afforded two isomers 14a and 14b in a 1.5:1

Scheme 3 Reagents and conditions: i, NBS, reflux, CCl₄ then Et₃N, 80 85°C, CCl₄, 69%; ii, Na, NH₃, -33°C, THF, EtOH; iii, CH₂N₂, 0°C, Et₂O, 67% overall (40% **14a**; 27% **14b**).

As indenone 12 was prone to dimerisation at high temperatures or in the presence of Lewis acids, high pressure 85 activation was instead employed for the [4+2] cycloaddition reaction. When 12 and 14a were subjected to 19 KBar for 24 hours, cycloadduct 15 was obtained as a single product in 52% yield (Scheme 4). The endo stereochemistry was established by NOE differential spectral analysis of the 90 observed correlations between the protons of the ethane bridge with the cyclopentanone ring protons. Methyl ester 15 was hydrolysed to afford acid 16, which was submitted to reduction with lithium triethylborohydride, followed by reesterification with diazomethane. Following 95 iodoetherification, tetrahydrofuran 19 was obtained in 75% yield over 3 steps from acid 16. The iodide was then subjected to reduction with tri-n-butyltin hydride furnishing methyl ester 20. Hydrolysis of 20 produced carboxylic acid 21 which was subsequently converted to diazoketone 10.

Scheme 4 *Reagents and conditions:* i, 19KBar, rt, DCM, 52%; ii KOH, rt, H₂O, EtOH, 96%; iii, LiEt₃BH, 0°C, THF; iv, CH₂N₂, 0°C, Et₂O, 90% overall; v, NIS, rt, THF, 75%; vi, AIBN, *n*-Bu₃SnH, reflux, THF, 95%; vii, KOH, rt, H₂O, EtOH, 93%; viii, NaH, rt, THF; ix, (COCl)₂, DMF, 0°C, THF; x, CH₂N₂, 0°C, Et₂O, 75% overall.

Having secured diazoketone 10, we reached the pivotal step for this initial model study. Based on our previous synthesis, rhodium mandelate was chosen as the catalyst for the initial test. Unfortunately, in our model system, these conditions provided CH-insertion compound 22 as the only isolable product (Scheme 5). A variety of alternative rhodium catalysts, such as Rh₂(OAc)₄ and Rh₂(acam)₄, ¹⁰ were similarly unsuccessful. Copper(II) acetylacetonate has proven to be an effective catalyst for the cyclopropanation of aromatic rings, ¹¹ but it was unsuccessful in this instance. Finally, the desired product was obtained on treatment of diazoketone 10 with bis(*N-t*-butylsalicylaldiminato) copper(II). ¹².

Scheme 5 *Reagents and conditions:* i, Rh(mandelate)₄, reflux, DCM, 47% ii, bis(*N-t*-butylsalicylaldiminato) copper(II), reflux, toluene, 30%.

Having demonstrated that geometrical restraints still permitted cyclopropanation to take place, we next turned our attention to the installation of the lactone-ring framework of the harringtonolide molecule by means of a [4+2] cycloaddition reaction with a suitable pyrone (Scheme 6). A high pressure Diels-Alder reaction between 12 and 24 furnished cycloadduct 25 as a single product in 72% yield with the desired *endo* stereochemistry being confirmed by spectral analysis and X-ray crystallography. ¹³

Scheme 6 Reagents and conditions: i, 19KBar, rt, DCM, 72%.

140 The next phase involved the construction of the internal framework of the molecule. This entailed the formation of an ether bond to introduce the tetrahydrofuran moiety and the incorporation of a bridge methyl group with the correct stereochemistry. Based upon previous work, the prospect of forming the tetrahydrofuran ring in harringtonolide by a process equivalent to 26 → 28 appeared to be feasible (Scheme 7).⁵

150 Scheme 7 Reagents and conditions: i, Hg(NO₃)₂; ii, KBr; iii, NaBH₄, rt, DME, 80% overall.

Accordingly, ketone 25 was reduced to benzylic alcohol 29 in 77% yield (Scheme 8). A combination of diazomethane and a 155 catalytic amount of palladium acetate afforded 30 in almost quantitative yield. Unfortunately, subsequent mercurymediated ring-opening was wholly unsuccessful, despite recourse to a wide range of reagents and conditions. Attempted iodoetherification of intermediate 29 as per 18 → 160 19 merely resulted in oxidation of 29 to ketone precursor 25. Additional work would reveal the olefinic bond in 29 to be quite unreactive towards an array of different reagents, most likely a result of the electron-withdrawing nature of the adjacent lactone ring. 14

Scheme 8 Reagents and conditions: i, NaBH₄, rt, MeOH, THF, 77%; ii, CH₂N₂, Pd(OAc)₂, 0°C, Et₂O, 95%.

170 In an effort to overcome this unexpected lack of reactivity, we decided to incorporate a methyl group into the 4-position of the pyrone, thereby obviating the need for the cyclopropyl ring-opening step entirely and with the additional benefit of increasing the electron density of the olefinic bond of the 175 Diels-Alder adduct. Treating 24 with ethereal diazomethane afforded 32 in 82% yield (Scheme 9).15 When the newly prepared pyrone 32 and indenone 12 were subjected to high pressure, cycloadduct 33 was obtained. Elaboration of 33 posed an interesting challenge. Attack of an electrophilic 180 reagent on the more exposed face of the olefinic bond would position the methyl group over the aromatic ring with the undesired endo stereochemistry. Accordingly, an indirect strategy was employed. Reduction of 33 to benzylic alcohol 34 followed by hydroboration-oxidation afforded diol 35 with 185 the methyl substituent in the endo location. Oxidation of 35 with the Dess-Martin periodinane furnished diketone 36.16 Treatment of the diketone with a catalytic amount of DBU effected the epimerisation of 36 to the thermodynamic product 37 with the methyl group now adopting the requisite exo 190 stereochemistry. The transformation of 36 to 37 was manifestly apparent from the ¹H-NMR spectrum. The bridge methyl, which had appeared as a doublet at $\delta 0.49$ in 36, now had a chemical shift of $\delta 1.35$ in 37. This large downfield shift can be ascribed to the removal of the methyl group from the 195 shielding effect of the aromatic ring. Reduction of diketone 37 afforded syn diol 38. Treatment of 38 with paratoluenesulfonic acid led to formation of the benzylic cation and trapping by the remaining hydroxyl to install the tetrahydrofuran ring system (31).

Scheme 9 *Reagents and conditions:* i, CH₂N₂, 0°C, DCM, 82%, ii, 19KBar, rt, DCM, 73%; iii NaBH₄, rt, MeOH, THF, 85%; iv, 205 BH₃.DMS, 0°C, THF then Et₃NO, reflux, THF, 49%; v, DMP, rt, *t*BuOH, THF, 48%; vi, DBU, rt, THF, 72%; vii, NaBH₄, rt, MeOH, THF, 66%; viii, *p*-TsOH, THF, 71%.

Demethylation of **31** was accomplished by the method of Fujita *et al.* using a combination of aluminium tribromide and tetrahydrothiophene (Scheme 10).¹⁷ **39** was then converted to the corresponding acid chloride which was immediately reduced to primary alcohol **40**. Following oxidation of the carbinol to **41**, the aldehyde was added to an excess of the methoxymethylene ylide thereby producing (*Z*)-methylenol ether **42** in 58% yield. The enol ether was hydrolysed to the homologated aldehyde **43** and then oxidised to carboxylic acid **44**. The acid chloride, generated by addition of the Vilsmeier reagent to a benzene solution of **44**, was converted *in situ* to diazoketone **45** with ethereal diazomethane. A strong band at 2106 cm⁻¹ in the IR spectrum was characteristic of the asymmetric diazo stretch while a molecular ion of m/z 354

was accompanied by a fragmentation pattern showing loss of nitrogen to produce a peak at m/z 328.

Scheme 10 Reagents and conditions: i, Tetrahydrothiophene, AlBr₃, 0°C, DCM, 69%; ii (COCl)2, DMF, 0°C, benzene then NaBH4, 0°C, THF, 71%; iii, DMP, rt, tBuOH, THF, 92%; iv, [Ph₃PCH₂OMe]Cl, 230 LiHMDS, 0°C, THF, 58%; v, HCl, rt, H2O, THF, 83%; vi, NaClO2, H₂O₂, 0°C, H₂O, ACN, 65%; vii, (COCl)₂, DMF, 0°C, benzene; viii, CH₂N₂, 0°C, Et₂O, 62% overall; ix, CH₂N₂, 0°C, Et₂O, 96%.

Heating diazoketone 45 in the presence of bis(N-t.-235 butylsalicylaldiminato) copper(II) resulted in a complex mixture of products. Unfortunately, it was evident from the ¹H-NMR spectrum that no arene cyclopropanation had taken place. Neither the use of Cu(acac)₂ nor of Rh(OAc)₂ were successful - both catalysts merely produced a complex 240 mixture of aromatic compounds. The most likely explanation for the failure of the arene cyclopropanation sequence involves carbonyl ylide formation with the lactone ring. 18, 19 Masking of carbonyls as ortho acetals has previously been used to circumvent ylide formation.²⁰ Accordingly, acid 44 245 was protected as the methyl ester 46 using diazomethane. Regrettably, we were unable to transform 46 to the corresponding ortho acetal derivative. Even powerful reagents such as the Meerwein salt method²¹ or Noyori's method²² failed to effect the desired transformation.

At this point, we opted to revise our synthetic approach. First, we would incorporate the C8 methyl, which corresponds to the tropone methyl substituent, into the indenone intermediate. Secondly, we would seek to increase the 255 reactivity of the olefinic bond in the cycloadduct by reducing the carboxyl group at an early stage in the synthetic plan. Finally, we would investigate the feasibility of blocking unwanted ylide formation by reduction of the lactone and subsequent protection of the resultant lactol.

Demethylation of 32 to carboxylic acid 47 by in situ generation of trimethylsilyl iodide proceeded well (Scheme 11). Meanwhile, bromination of indanone 48, a known compound,²³ and subsequent elimination afforded indenone 4 265 in 63% yield. Once again, a high pressure Diels-Alder reaction between 47 and 4 furnished cycloadduct 49 with the required regio- and stereochemistry. 49 was converted to the corresponding acid chloride and then reduced to carbinol 50. This alcohol was subsequently protected as the tert-270 butyldimethyl silyl ether 51 in good yield.

Scheme 11 Reagents and conditions: i, I2, (SiMe3)2, reflux, CHCl3, 75%; i, NBS, reflux, CCl₄ then Et₃N, 85°C, CCl₄, 63%; iii, 19KBar, 275 rt, DCM, 68%; iv, (COCl)₂, DMF, 0°C, THF then NaBH₄, 0°C, THF, 66%; v, TBDMSOTf, N, N-diisopropylethylamine, 0°C, DCM, 83%.

Applying the previously established methodology, ketone 51 was reduced to the benzylic alcohol 52 and, following 280 hydroboration-oxidation of the olefinic bond, diol 53 was oxidised to diketone 54 (Scheme 12). Treatment of 54 with a catalytic amount of DBU afforded epimer 55 in 98% yield. Interestingly, while the epimerisation of 36 to 37 had provided a 1:3 ratio of endo:exo products, conversion of 54 to 55 went 285 to completion with no starting material remaining. This unexpected result is presumably due to the bulky TBDMS ether side chain, which favours the thermodynamic product through steric interaction. Indeed, MM2 calculations suggest a 2.01 kcal/mol energy difference between 54 and 55 as 290 compared to a gap of only 0.29 kcal/mol between 36 and 37. Reduction of 55, followed by acidic work-up, afforded ether **56** in 64% yield.

²⁹⁵ Scheme 12 Reagents and conditions: i NaBH₄, rt, MeOH, THF, 89%; ii, BH₃.DMS, 0°C, THF then Et₃NO, reflux, THF, 38%; iii, DMP, rt, tBuOH, THF, 58%; iv, DBU, rt, THF, 98%; v, NaBH₄, rt, MeOH, THF then HCl work-up, 64%.

300 Finally, we proposed reducing the lactone to the corresponding lactol, followed by masking of the resultant hydroxyl with a bulkly protecting group, namely a TBDMS ether. The reason for the introduction of this group was twofold - first, to block any reaction between the carbenoid 305 and the free hydroxyl and secondly, to direct the carbenoid towards the aromatic ring. Previous studies on gibberellin intermediates had demonstrated that a DIBAL reduction could be conducted in the presence of a dichloroacetate protecting group.²⁴ With this information in mind, we returned to 310 substrate 56 and the TBDMS ether was cleaved with tetrabutylammonium fluoride to afford the primary alcohol 57, which was then reprotected as the dichloroacetate 58 (Scheme 13). Reduction of 58 with DIBAL at -40°C furnished the desired hemi-acetal 59 in 57% yield. Protection of the hemi-315 acetal as the TBDMS ether 60 proceeded readily while subsequent hydrolysis of the acetate ester furnished advanced intermediate 61.

320 **Scheme 13** Reagents and conditions: i, TBAF, rt, THF, 95%; ii, dichloroacetyl chloride, pyridine, rt, DCM, 96%; iii, DIBAL-H, -40°C, toluene, 57%; iv, TBDMSOTf, *N*,*N*-diisopropylethylamine, rt, DCM, 72%; Et₃N, rt, H₂O, MeOH, 90%.

325 Conclusions

These preliminary model studies have allowed us to investigate the feasibility of a more concise route to the complex diterpenoid, harringtonolide. While our initial studies demonstrated that the geometry of the molecule is suitable for arene-cyclopropanation purporse, we have also uncovered a number of unforeseen obstacles. In particular, the low reactivity of the olefinic bond of the Diels-Alder cycloadduct and the propensity of the α-diazoketone intermediate to undergo unwanted ylide formation with the lactone ring moiety were problematical. We have successfully incorporated the bridge methyl substituent *via* the pyrone starting material and have controlled its stereochemical orientation in subsequent work.

Scheme 14 Remaining steps in the synthesis of harringtonolide

Finally, we have modified the chemistry of the lactone ring 345 and incorporated a bulky protecting group in the expectation

of blocking ylide formation and directing cyclopropanation towards the aromatic ring. We hope to report on our work on the remaining steps (Scheme 14) and the completion of this synthesis in due course.

Experimental

General Experimental

Starting materials and reagents used in reactions were obtained commercially and were used without purification, 355 unless otherwise indicated. Flash chromatography was conducted with Merck Kieselgel 60 silica gel as the adsorbent. Proton nuclear magnetic resonance (¹H-NMR) spectra were recorded on a Varian Gemini 300 spectrometer at 300 MHz. Carbon-13 nuclear magnetic resonance (13C-NMR) were 360 recorded on Varian Gemini 300 spectrometer at 75.5 MHz. Infrared (IR) spectra (v_{max}) were recorded on a Perkin-Elmer 683 Infrared spectrophotometer in 0.25 mm NaCl solution cells or recorded on a Perkin-Elmer 1800 Fourier Transform Infrared spectrophotometer in KBr plates. Low resolution EI 365 mass (LRMS) spectra (70 eV) and high resolution accurate mass measurements (HRMS) were recorded on a VG Autospec double focussing mass spectrometer. Melting points (mp) were recorded on a Reichert hot-stage and are uncorrected. Microanalyses were conducted by the Australian 370 National University Analytical Services Unit, Canberra.

5-Methoxyindenone (12).

375 N-Bromosuccinimide (356 mg, 2 mmol) was added to a solution of the indanone 11 (324 mg, 2 mmol) in carbon tetrachloride (50 ml). The resulting suspension was stirred at reflux with irradiation from a tungsten lamp for 2 hours. Triethylamine (1 ml) was added, then the reaction mixture 380 was stirred at 85°C (oil bath) for a further 2 hours. The mixture was filtered through a short column of silica gel and washed with petroleum ether $40-60^{\circ}$ C: ethyl acetate = 1:1. The solvent was removed under reduced pressure and the residue was purified by flash chromatography on silica gel 385 (Petroleum ether $40-60^{\circ}$ C: ethyl acetate = $10:1\rightarrow2:1$) to afford 5-methoxyindenone (12) (218 mg, 69%) as a yellow oil; $v_{\text{max}}/\text{cm}^{-1}$ 3005 (ArH), 1707 (C=O), 1251 (ArOCH₃), 1230 (CC=OC), 1037 (ArOCH₃); δ_H (300MHz, CDCl₃) 7.40 (1H, d, J = 5.8 Hz, H-3, 7.36 (1H, d, J = 7.7 Hz, H-7), 6.59 (1H, d, J $_{390} = 2.2 \text{ Hz}, \text{ H-4}), 6.58 (1\text{H}, \text{dd}, J = 2.2, J = 7.7 \text{ Hz}, \text{ H-6}), 5.87$ (1H, d, J = 5.8 Hz, H-2), 3.82 (3H, s, CH₃O); δ_C (75MHz, CDCl₃) 196.88 (C1), 164.37 (C5), 147.52 (C3), 147.10 (C3a), 128.65 (C2), 124.28 (C7), 122.87 (C7a), 110.97 (C6), 110.36 (C4), 55.53 (CH₃O); m/z 160 (M⁺, 40%), 145 (2), 132 (10), 395 117 (18), 106 (12), 89 (87), 78 (5), 74 (28), 70 (68), 66 (10), 61 (100). $_{\beta\alpha}$ $\alpha\beta$

Methyl-2-(1'-methoxycyclohexa-1',3'-dienyl)ethanoate (14a) and Methyl-2-(1'-methoxycyclohexa-1',4'-400 dienyl)ethanoate (14b).

Liquid ammonia (150 ml) was added to a solution of 2-(4'methoxybenzene)-ethanoic acid (13) (3.32 g, 20 mmol) in ethanol (10 ml) and THF (20 ml). Sodium (metal, 3.2 g, 140 mmol, 7 eq.) was added in small pieces over a period of 405 approximately 1 hour until the blue colour persisted for 4 minutes. The ammonia was allowed to evaporate overnight. Ice (200 g) was added to the residue. The resulting mixture was acidified with 1M HCl (pH = 5), and then extracted with ethyl acetate (4x80 ml). The combined organic phase was 410 washed with water (2x40 ml), brine (40 ml) and dried over sodium sulfate. After filtration, the solvent was removed under reduced pressure and the residue was treated with ethereal diazomethane at 0°C. After removal of the solvent, the residue was purified by flash chromatography on silica gel (Petroleum ether 40-60°C: ethyl acetate = $100:1\rightarrow20:1\rightarrow10:1$) to afford an inseparable mixture of the methyl esters (14a: 14b = 1.5 :1; 2.46 g, 67%) as a pale yellow oil.

Methyl-2-(1'-methoxycyclohexa-1',3'-dienyl)ethanoate 420 (14a).

 $\delta_{\rm H}$ (300MHz, CDCl₃) 5.69 (1H, d, J=6.0 Hz, H-C=C), 4.85 (1H, d, J=6.1 Hz, H-C=C-OCH₃), 3.62 (3H, s, OCH₃), 3.52 (3H, s, OCH₃), 3.01 (2H, m), 2.72 (2H, m), 2.25 (2H, s, 2x H-2).

Methyl-2-(1'-methoxycyclohexa-1',4'-dienyl)ethanoate (14b).

 $\delta_{\rm H}$ (300MHz, CDCl₃) 5.50 (1H, m, *H*-C=C), 4.55 (1H, m, *H*-C=C-OCH₃), 3.62 (3H, s, OC*H*₃), 3.49 (3H, s, OC*H*₃), 2.96 (2H, m), 2.72 (1H, m), 2.25 (2H, s, 2x H-2), 1.95 (1H, m).

(1RS,4SR,4aRS,9aSR)-1,6-Dimethoxy-4-methoxycarbonylmethyl-9-oxo-4,4a,9,9a-tetrahydro-1,4-ethano-1*H*-fluorene (15).

435 The indenone 12 (160 mg, 1 mmol) and a mixture of dienes 14a and 14b (364 mg, 2 mmol) were dissolved in dichloromethane (1 ml) under nitrogen. The reaction mixture was then subjected to high pressure (19 Kbar) for 2.5 hours. The resulting mixture was purified by flash chromatography 440 on silica gel (Petroleum ether 40-60°C: ethyl acetate = $10:1\rightarrow 5:1\rightarrow 1:1$) to afford the cycloadduct 15 (178 mg, 52%, based on indenone) as white needles; mp 139-140 °C (from EtOAc); Found: C, 70.18%; H, 6.35%. Calc. for C₂₀H₂₂O₅: C, 70.16%; H, 6.48%; $v_{\text{max}}/\text{cm}^{-1}$ 3030 (ArH), 2950 (CH), 1760 445 (C=O), 1700 (C=O), 1255 (ArOCH₃), 1090 (C-O), 1030 (ArOCH₃); δ_H (300MHz, CDCl₃) 7.63 (1H, d, J = 8.5 Hz, H-8), 7.08 (1H, d, J = 2.1 Hz, H-5), 6.87 (1H, dd, J = 2.2, J =8.6 Hz, H-7), 6.04 (1H, d, J = 8.7 Hz, H-2), 5.42 (1H, d, J =8.7 Hz, H-3), 3.85 (3H, s, CH_3O-C6), 3.74 (3H, s, $COOCH_3$), 450 3.55 (1H, d, J = 7.1 Hz, H-4a), 3.52 (3H, s, CH_3O-C1), 3.00 (1H, d, J = 7.1 Hz, H9a), 2.95 (1H, d, J = 15.0 Hz, H-12A),2.78 (1H, d, J = 15.0 Hz, H-12B), 1.99-1.84 (2H, m, H-10 α , H-11α), 1.62-1.42 (2H, m, H-10β, H-11β); δ_C (75MHz, CDCl₃) 202.20 (C9), 71.95 (COO), 164.55 (C6), 156.21 455 (C4b), 133.86 (C2), 132.91 (C8a), 131.76 (C3), 125.27 (C8), 114.98 (C7), 111.07 (C5), 79.28 (C1), 55.59 (CH₃O-C₆), 52.58 (C9a), 51.64 (COOCH₃), 50.84 (CH₃O-C1), 46.62 (C4a), 40.41 (C4), 40.11 (C12), 31.01 (C10), 28.30 (C11); *m/z* 342 (M⁺, 5%), 311 (12), 279 (3), 269 (15), 254 (6), 241 (30), 460 227 (4), 195 (4), 182 (100), 161 (8), 149 (27), 134 (7), 123 (69), 109 (20), 91 (17), 77 (13).

(1RS,4SR,4aRS,9aSR)-4-Carboxymethyl-1,6-dimethoxy-9-oxo-4,4a,9,9a-tetrahydro-1,4-ethano-1*H*-fluorene (16).

465 The methyl ester 15 (410 mg, 1.2 mmol) and potassium hydroxide (1.01 g, 18 mmol, 15 eq.) were dissolved in ethanol (25 ml) and water (5 ml). The reaction mixture was stirred at room temperature for 2 hours. Ice (100 g) was added, then acidified with 1M HCl (20 ml) and extracted with chloroform 470 (5x25 ml). The combined organic phase was dried over sodium sulfate. After filtration, the solvent was removed under reduced pressure and the residue was purified by flash chromatography on silica gel (Petroleum ether 40-60°C: ethyl acetate = $2:3 \rightarrow 0:1 \rightarrow DCM:MeOH = 10:1 \rightarrow 5:1)$) to afford the 475 acid 16 (380 mg, 96.4%), after recrystallisation from ethyl acetate, as colourless needles; mp 221-222 °C (from EtOAc); Found: C,69.43%; H,6.15%. Calc. for C₁₉H₂₀O₅: C,69.50%; H,6.14%; v_{max}/cm⁻¹ 3500 (COOH), 3020 (ArH), 2940 (CH), 1700 (C=O), 1260 (ArOCH₃), 1090 (C-O); δ_H (300MHz, 480 CDCl₃) 7.67 (1H, d, J = 8.5 Hz, H-8), 7.07 (1H, d, J = 2.1 Hz, H-5), 6.90 (1H, dd, J = 2.1, J = 8.5 Hz, H-7), 6.08 (1H, d, J =8.7 Hz, H-2), 5.45 (1H, d, J = 8.7 Hz, H-3), 3.87 (3H, s, CH_3O-C6), 3.62 (1H, d, J = 7.0 Hz, H-4a), 3.54 (3H, s, CH_3O-C6) C_1), 3.03 (1H, d, J = 7.0 Hz, H-9a), 3.02 (1H, d, J = 14.8 Hz, $_{485}$ H-12A), 2.86 (1H, d, J = 14.8 Hz, H-12B), 2.05-1.95 (2H, m, H-10 α , H-11 α), 1.64-1.56 (2H, m, H-10 β , H-11 β); δ_C (75MHz, CDCl₃) 203.37 (C9), 173.59 (COOH), 164.70 (C6), 156.73 (C4b), 132.85 (C2), 132.32 (C8a), 132.18 (C3), 124.94 (C8), 115.18 (C7), 110.81 (C5), 79.27 (C1), 55.35 (CH₃O-C₆), 490 52.57 (C9a), 50.50 (CH₃O-C₁), 46.22 (C4a), 40.10 (C4), 39.74 (C12), 30.58 (C10), 28.01 (C11); m/z 328 (M⁺, 2%), 311 (0.7), 300 (1.2), 269 (5), 255 (4), 240 (35), 168 (100), 134 (7), 123 (65), 109 (18), 91 (12), 77 (9), 63 (6).

495 (1RS,4SR,4aRS,9RS,9aRS)-1,6-Dimethoxy-9-hydroxy-4-methoxy-carbonylmethyl-4,4a,9,9a-tetrahydro-1,4-ethano-1*H*-fluorene (18).

A solution of the ketone 16 (295 mg, 0.9 mmol) in anhydrous THF (50 ml) was cooled to 0°C. Lithium triethylborohydride 500 (1M in THF, 2.7 ml, 2.7 mmol, 3.0 eq.)was added dropwise. After addition, the reaction mixture was stirred at room temperature for 2 hours. Water (5 ml) was then added to decompose the excess of super-hydride. The resulting mixture was diluted with ethyl acetate (150 ml) and washed with water 505 (50 ml, containing 1M HCl 4 ml) and brine (30 ml). The aqueous phase was extracted with chloroform (2x25 ml). The combined organic phase was dried over sodium sulfate. After filtration, the solvent was removed and the residue was esterified with an ethereal solution of diazomethane. After 510 removal of the solvent, the residue was purified by flash chromatography on silica gel (Petroleum ether 40-60°C: ethyl acetate = $4:1\rightarrow 2:1\rightarrow 1:1$) to afford the methyl ester 18 (278) mg, 90%) as a colourless oil; v_{max}/cm^{-1} 3640 (OH), 3030 (ArH), 2950 (CH), 1730 (C=O), 1240 (ArOCH₃), 1210 ₅₁₅ (CC=OC), 1130 (C-OH), 1095 (C-O), 1000 (ArOCH₃); δ_H (300MHz, CDCl₃) 7.25 (1H, d, J = 8.4 Hz, H-8), 6.83 (1H, d, J = 2.4 Hz, H-5, 6.78 (1H, dd, J = 2.4, J = 8.4 Hz, H-7, 6.28(1H, d, J = 8.8 Hz, H-2), 5.53 (1H, d, J = 8.8 Hz, H-3), 5.24 (1H, d, J = 8.4 Hz, H-9), 3.73 (3H, s, CH_3O -C6), 3.68 (3H, s, COOC H_3), 3.44 (1H, d, J = 8.4 Hz, H-4a), 3.42 (3H, s, CH_3O -C1), 2.99 (1H, dd, J = 8.4, J = 8.5 Hz, H-9a), 2.92 (1H, d, J = 15.1 Hz, H-12A), 2.84 (1H, d, J = 15.1 Hz, H-12B), 1.85 (1H, m, H-11β), 1.69 (2H, m, H-10x2), 1.40 (1H, m, H-11α); $δ_C$ (75MHz, CDCl₃) 171.99 (COO), 159.59 (C6), 143.23 (C4b), 525 137.54 (C8a), 133.53 (C2), 130.67 (C3), 125.67 (C8), 113.51 (C7), 110.57 (C5), 80.34 (C1), 75.70 (C9), 55.10 (CH_3O -C6), 54.32 (C9a), 51.02 (COO CH_3), 50.94 (C4a), 50.49 (CH_3O -C1), 40.38 (C4), 40.02 (C12), 31.25 (C10), 27.97 (C11); m/z 344 (M^+ , 10%), 327 (6), 312 (24), 297 (6), 252 (7), 239 (15), 530 225 (8), 202 (14), 182 (84), 167 (32), 145 (90), 121 (100), 102 (28), 91 (23), 77 (14).

Sodium hydride (60% in mineral oil, 80 mg, 2 mmol, 6 eq.) was washed with anhydrous THF (3 times). The acid 21 (110 mg, 0.33 mmol) in THF (8 ml) was then added via a cannula and washed with THF (6 ml). The resulting suspension was 645 stirred at ambient temperature for 20 minutes. DMF (160 µl, 2 mmol, 6 eq.) was added, followed by oxalyl chloride (180 µl, 2.1 mmol, 6 eq.) at 0°C. The reaction mixture was stirred at room temperature under nitrogen for 20 hours, then carefully filtered into an ethereal diazomethane solution at 0°C. The 650 reaction was allowed to proceed at room temperature for 30 minutes. The resulting mixture was filtered through a short column of silica gel and washed with ethyl acetate. After removal of the solvent, the residue was purified by flash chromatography on silica gel (Petroleum ether 40-60°C: ethyl acetate = $2:1 \rightarrow 1:1 \rightarrow 1:2 \rightarrow 0:1$) to yield the diazo ketone 10 (88 mg, 74.6%) as a yellow oil; v_{max}/cm^{-1} 3000 (ArH), 2950 (CH), 2110 (CHN₂), 1670 (C=O); δ_H (300MHz, CDCl₃) 7.34 (1H, d, J = 8.2 Hz, H-8), 6.92 (1H, d, J = 2.4 Hz, H-5), 6.78(1H, dd, J = 2.4, J = 8.2 Hz, H-7), 5.24 (1H, d, J = 5.1 Hz, H-660 9), 5.20 (1H, brs, CHN₂), 4.12 (1H, d, J = 7.2 Hz, H-2), 3.77 (3H, s, CH₃O-C6), 3.47 (1H, d, J = 8.8 Hz, H-4a), 3.28 (3H, s, CH₃O-C1), 3.01 (1H, ddd, J = 1.5, J = 5.1, J = 8.8 Hz, H-9a), 2.38 (1H, d, J = 14.4 Hz, H-12A), 2.04 (1H, d, J = 14.4 Hz, H-12B), 1.96 (3H, m), 1.64 (2H, m), 1.20 (1H, dd, J = 2.5, J =665 14.7 Hz, H-3β); δ_C (75MHz, CDCl₃) 193.45 (CO), 159.94 (C6), 146.12 (C4b), 136.98 (C8a), 125.95 (C8), 113.14 (C7), 112.24 (C5), 84.04 (C9), 83.14 (C1), 77.64 (C2), 55.41 (CH₃O-C6), 55.37 (CHN₂), 51.83 (CH₃O-C1), 51.18 (C4a), 50.02 (C9a), 44.48 (C12), 41.57 (C3), 35.12 (C10), 32.28 670 (C4), 19.08 (C11); *m/z* 354 (M⁺, 4%), 326 (100), 298 (51), 283 (20), 270 (17), 251 (35), 241 (80), 223 (44), 202 (58), 171 (37), 158 (52), 146 (76), 128 (33), 102 (34), 91 (20), 71 (27).

(3aSR,5SR,5aRS,6RS,10bRS,10cRS,10eRS)-5,9-Dimethoxy-675 6,11-epoxy-2-oxo-2,3,3a,4,5,5a,6,10b-octahydro-5,10c-ethano-1*H*-cyclopenta[c]-fluorene (22).

A solution of diazoketone 10 (3 mg, 0.0085 mmol) in dichloromethane (2 ml) was added to a suspension of Rh2 (mandelate)4 (0.2 mg) in dichloromethane (2 ml) at reflux.
680 After the addition, the resulting mixture was stirred at reflux for a further 10 minutes. One drop of DBU was added and stirring was continued for another 2 minutes. After removal of the solvent, the residue was purified by flash chromatography on silica gel (Ethyl acetate) to afford an inseparable mixture 685 of C-H insertion products ($3a\alpha$: $3a\beta$ = 2:1; 1.3 mg, 46.9%) as a colourless oil.

Major isomer

 $\delta_{\rm H}$ (300MHz, CDCl₃) 7.38 (1H, d, J=8.3 Hz, H-7), 6.82 (1H, 690 dd, J=2.3, J=8.3 Hz, H-8), 6.62 (1H, d, J=2.3 Hz, H-10), 5.27 (1H, d, J=5.4 Hz, H-6), 4.34 (1H, d, J=8.5 Hz, H-11 α), 3.79 (3H, s, CH₃O-C9), 3.33 (3H, s, CH₃O-C5), 3.11 (1H, dd, J=1.8, J=8.7 Hz, H-10b), 3.02 (1H, ddd, J=1.7, J=5.4, J=8.7 Hz, H-5a), 2.70-2.55 (2H, m), 2.45-2.30 (2H,

⁶⁹⁵ m), 2.25 (1H, m), 1.93-1.60 (3H, m), 1.54 (1H, ddd, J = 2.0, J = 8.5, J = 13.9 Hz, H-12 α).

Minor isomer

δ_H (300MHz, CDCl₃) 7.38 (1H, d, J = 8.3 Hz, H-7), 6.82 (1H, dd, J = 2.3, J = 8.3 Hz, H-8), 6.62 (1H, d, J = 2.3 Hz, H-10), 5.36 (1H, d, J = 5.4 Hz, H-6), 4.13 (1H, dd, J = 1.7, J = 8.5 Hz, H-11α), 3.79 (3H, s, CH₃O-C9), 3.32 (3H, s, CH₃O-C5), 3.22 (1H, dd, J = 1.8, J = 8.7 Hz, H-8), 3.16 (1H, ddd, J = 1.7, J = 5.4, J = 8.7 Hz, H-5a), 2.90-1.50 (9H, m).

(2RS,3RS,3aRS,10aRS,10bRS)-3,7-Dimethoxy-2,4-epoxy-1,2,3,3a,4,5-hexahydro-10H,10bH-3,10a-ethanocyclohept[bc]acenaphthylen-9-one (23).

A solution of the diazoketone 10 (21 mg, 0.06 mmol) in 710 toluene (5 ml) was added dropwise to a solution of copper (II) bis(N-t.-butylsalicylaldiminato) (3 mg) in toluene (3 ml) at reflux. After the addition, the resulting mixture was stirred at reflux for a further 15 minutes. The reaction mixture was cooled to room temperature and one drop of DBU was added. 715 After stirring for 30 minutes at 40°C (oil bath), the solvent was removed and the residue was purified by flash chromatography on silica gel (Petroleum ether 40-60°C:ethyl acetate = $1:1\rightarrow1:5\rightarrow0:1$) to afford the product 23 (5.8 mg, 30%) as a yellow oil; $v_{\text{max}}/\text{cm}^{-1}$ 2924 (CH), 1730 (C=O), 1660 720 (C=O), 1245 (CC=OC); δ_H (300MHz, CDCl₃) 5.91 (1H, s, H-8), 5.44 (1H, dd, J = 2.6, J = 5.6 Hz, H-6), 4.89 (1H, d, J =3.7 Hz, H-4), 4.07 (1H, d, J = 5.0 Hz, H-2 α), 3.50 (3H, s, CH_3O-C7), 3.30 (3H, s, CH_3O-C3), 3.11 (1H, d, J = 10.2 Hz, H-10b), 3.01 (1H, m, H-5 α), 2.87 (1H, dd, J = 3.8, J = 9.9 Hz, 725 H-3a), 2.10-1.85 (3H, m), 1.70-1.45 (6H, m); δ_C (75MHz, CDCl₃) 197.37 (C9,CO), 155.47 (C7), 148.49 (C4a), 143.76 (C10c), 130.04 (C8a), 120.77 (C8), 94.75 (C6), 84.55 (C4), 83.67 (C3), 78.32 (C2), 55.82 (CH₃O-C7), 50.29 (C10b), 49.39 (CH₃O-C3), 47.43 (C10a), 45.57 (C3a), 38.69 (C12), 730 34.16 (C11), 33.99 (C10), 32.00 (C5), 19.18 (C1); m/z 326 $(M^+, 94\%), 325 (100), 310 (7), 295 (8), 281 (14), 265 (20),$
