Groundwater uranium origin and fate control in a river valley aquifer

by

Andre Banning, Thomas Demmel, Thomas R. Rüde, Michael Wrobel

- 12 pages, 5 figures, 7 tables -

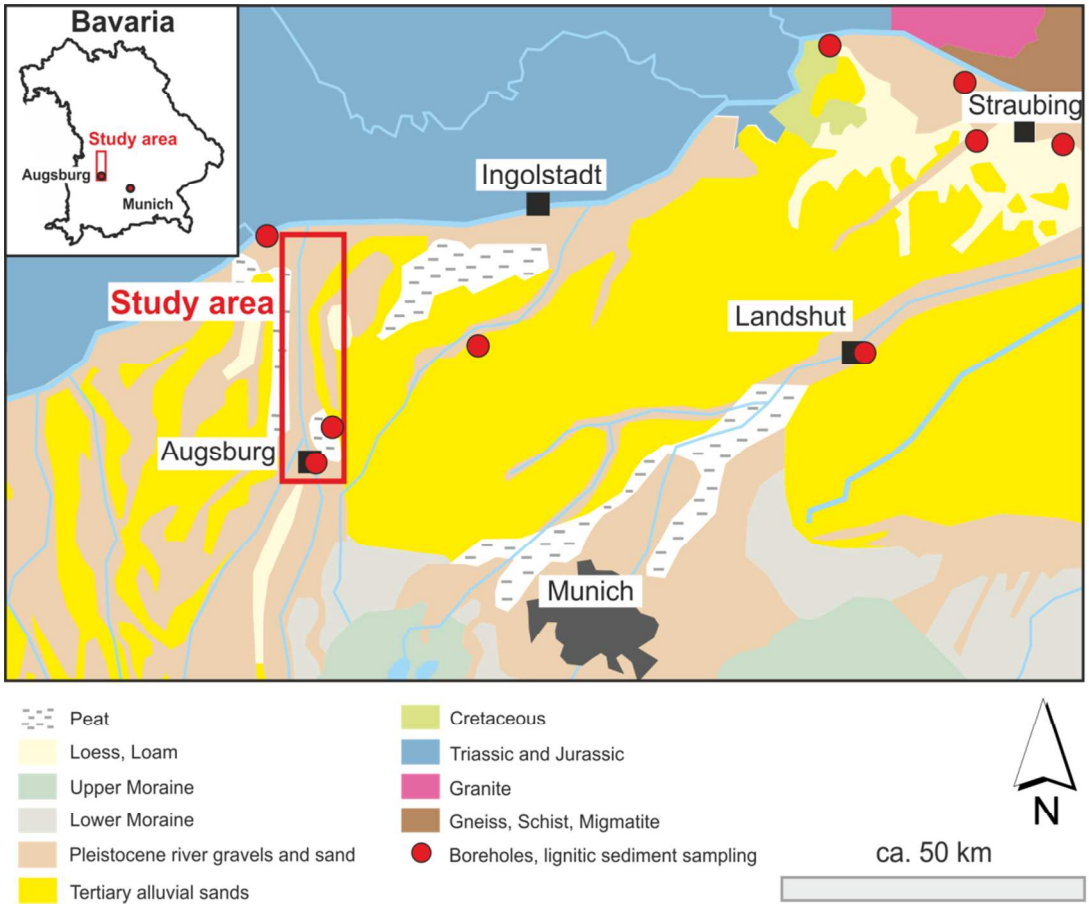

Figure S1. Location of the study area in Bavaria (upper left), geological overview map of the study area and its surroundings, and location of the 9 boreholes sampled for lignitic layers from the core warehouse of the Bavarian Environment Agency.

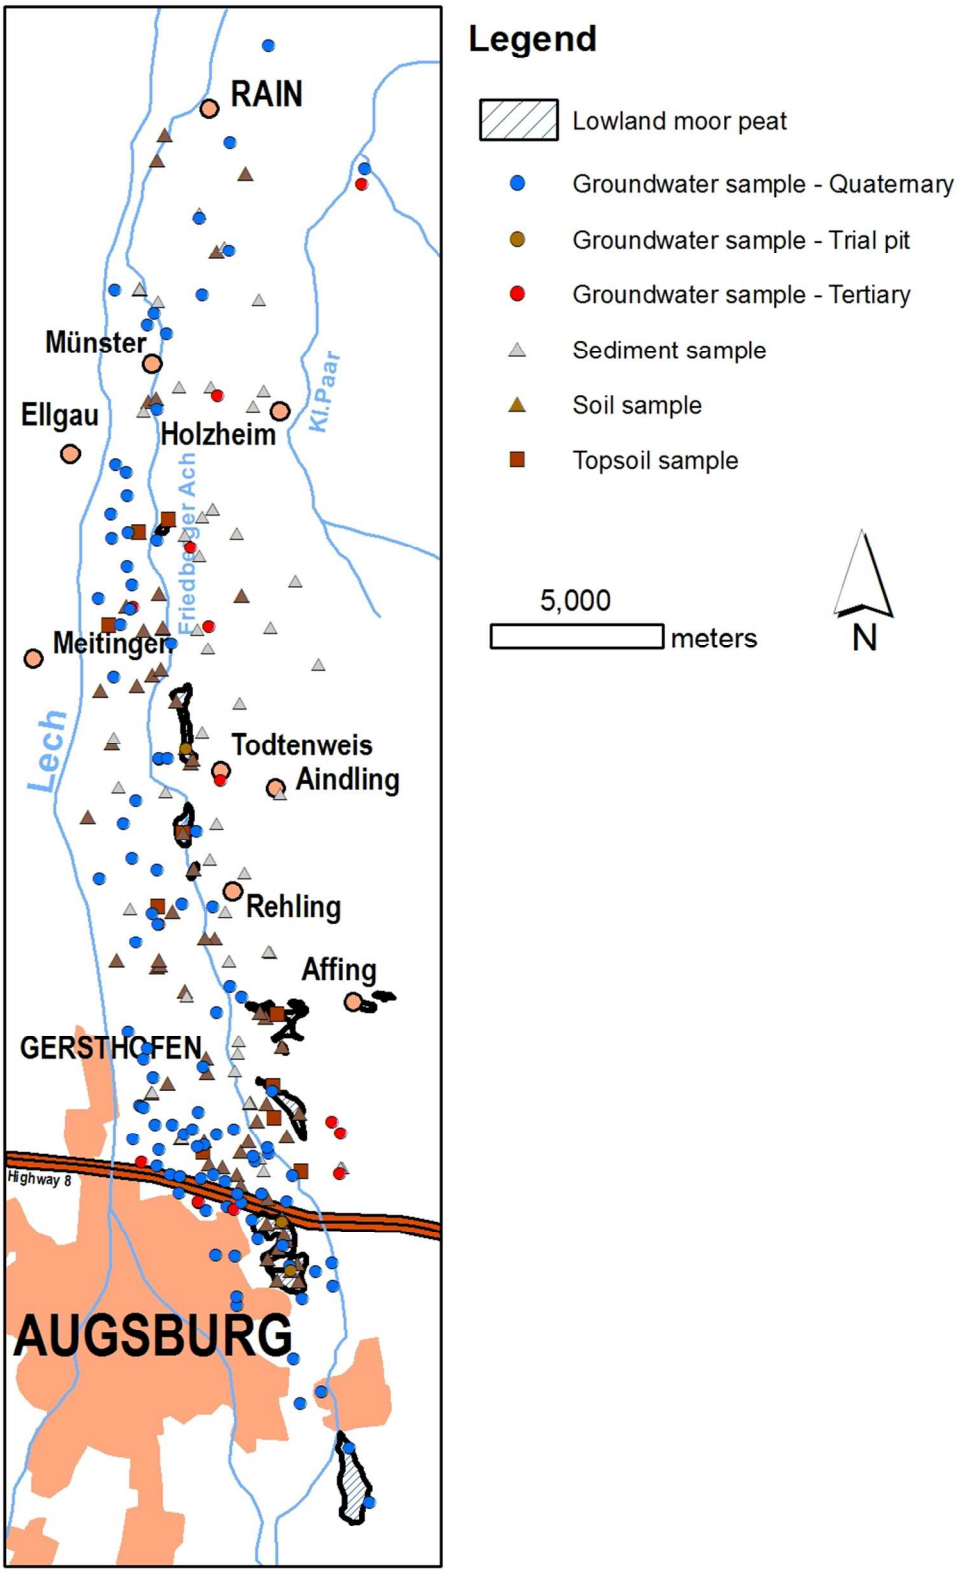

Figure S2. Study area map and sampling locations.

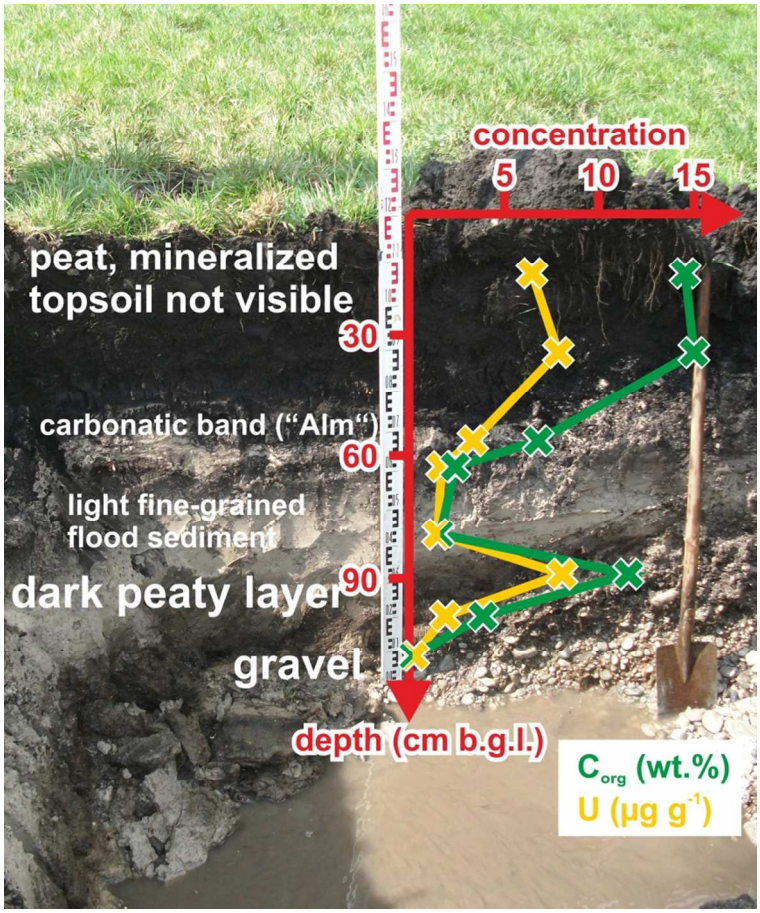

Figure S3. Profile and U/C_{org} development in trial pit 2.

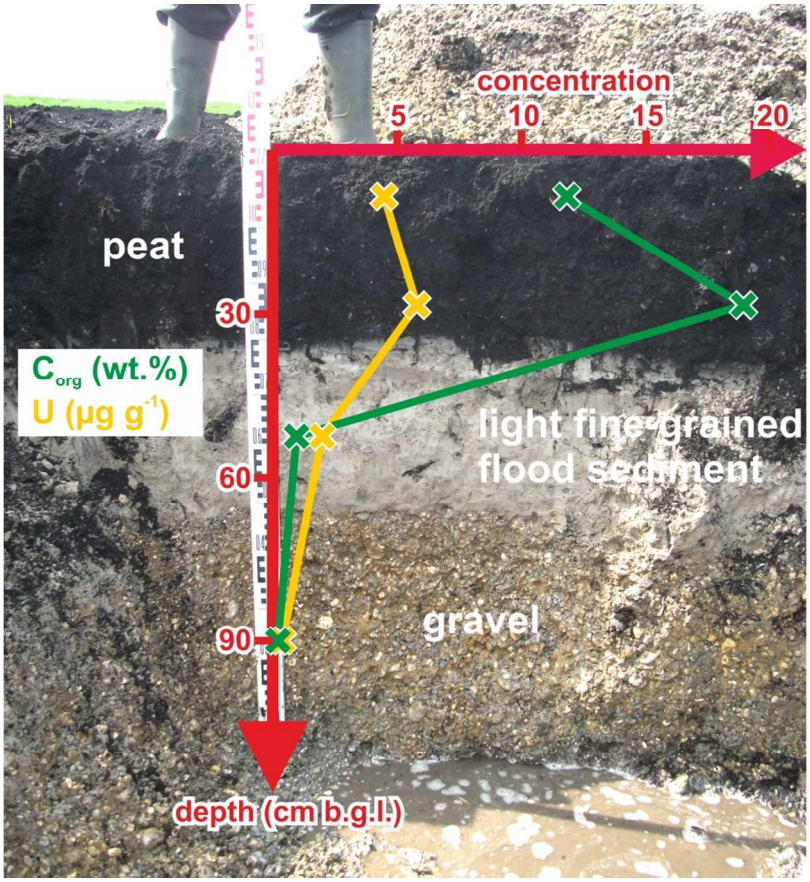

Figure S4. Profile and U/C_{org} development in trial pit 3.

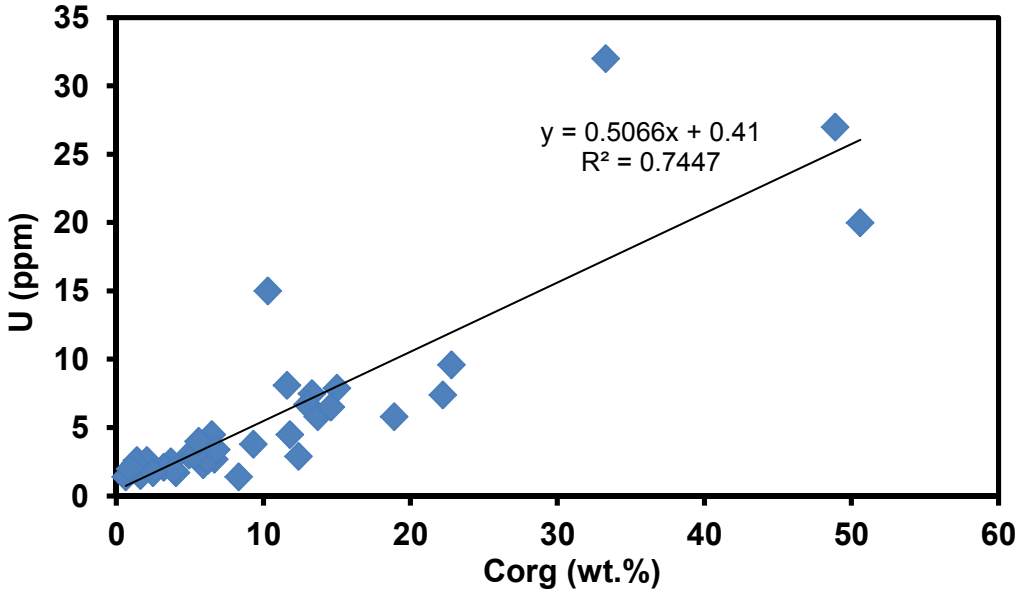

Figure S5. Scatter plot and regression of U and C_{org} in soil samples.

Table S1. Sediment geochemistry.

Table S4. Mineralogical composition of sediments and soils (XRD-Rietveld data).

The software BGMN was used to perform quantitative phase analysis which consists of an automatic, whole powder-pattern calculation and refinement of structural data (provided as mineral structure files of ideal phases ranging in unit cell axial lengths, developed by the Institute of Clay and Interface Mineralogy, RWTH Aachen University) against observed data. The programme performs an automated background refinement, allowing for the separation of an intensity difference curve containing the diagnostic Bragg reflections. These were allocated to mineral phases with the help of the aforementioned structure files and the database MINCRYST. Single phase structural information and sample mineralogical composition were refined aiming for minimum deviation, i.e. best fit, between model and observed data.
