# The equivalence of books: Monographs, prestige, and the rise of edge cases

**James O'Sullivan**

University College Cork, Ireland

## **Abstract**

The digital has shifted the forms through which we present scholarship, and as academic projects become increasingly disconnected with the codex form, our conceptions of what constitutes an academic book warrants problematization. This is particularly so with 'edge cases', projects which look to collate, curate, and create thematically consistent critical insights on topics of relevance to the Arts and Humanities, using unfamiliar forms. This brief essay explores a selection of digital projects that might be classified as edge cases, interacting with relevant stakeholders through short surveys designed to determine why digital apparatus were favored. The purpose of this essay is to query whether such outliers can be considered, as exemplifiers of what is meant by an edge case, to be the equivalent of the academic book.

## **Keywords**

Academic book of the future, academic books, digital humanities, digital publishing, edge cases, forms of scholarship, modes of production, publishing

Dichotomizing the monograph as form and content is an advantageous strategy when considering the academic book of the future. The digital has shifted the forms through which we present scholarship, and as academic projects become increasingly disconnected with the codex form, our conceptions of what constitutes an academic book warrants problematization. This is particularly so with 'edge cases', projects which look to collate, curate, and create thematically consistent critical insights on topics of relevance to the Arts and Humanities, using unfamiliar forms. Examining our classification of such edge cases is an important undertaking, as the book remains the most valuable currency of our discipline, and whether we might consider something to be bookish has profound professional repercussions for the future of our field. The forms of contemporary scholarship might have been transformed, but digital modes of dissemination have not

altered the purpose of this scholarship – for a book to be scholarly, however it is that a ‘book’ might be manifested, it must adhere to a set of underlying principles. The nature of academic content, unlike form, has remained consistent in terms of its critical rigor, interpretive qualities, and general intention, which is to create new knowledge and meaning. New forms have augmented the ways in which meaning can be shared and communicated, functioning as instruments for long-established critical practices that must always dictate, rather than facilitate, the frameworks from which they emerge.

The structure of edge cases is so varied that it would be infeasible to situate them within a stable taxonomy – valuable scholarship is increasingly appearing in the shape of digital resources, curated spaces, participatory- and community-based projects, visual representations, and a multiplicity of other arrangements that are clearly scholarly but not immediately distinguishable as academic books. This brief essay explores a selection of digital projects that might be classified as edge cases,<sup>1</sup> interacting with relevant stakeholders through short surveys designed to determine why digital apparatuses were favored. As acts of scholarly communication, these projects are outliers, availing of the affordances of digital platforms in a manner that goes beyond remediation. This is not a criticism of electronic forms that might be considered skeuomorphic, and the argument that we should ‘replace books with something different and better’ (Abba, 2013) suggests an underappreciation of the capabilities and possibilities of enduring designs like the codex. The purpose of this essay is to query whether such outliers can be considered, as exemplifiers of what is meant by an edge case, to be the equivalent of the academic book. ‘Equivalence’, in this context, refers to an output’s contribution to the scholarly record; the amount of knowledge, perspective, and meaning it generates and shares. This essay is based on the assumption that a scholarly book, as already noted, is about the systematic ordering and presentation of knowledge in a way that explicitly advances and challenges new and existing ideas – this is the basis on which assessment of the chosen exemplars is conducted.

Writing on this subject as part of their contribution to the AHRC-funded Academic Book of the Future project, Lyons and Rayner underline the importance of books: ‘Books matter. They contain knowledge, and knowledge, as the saying goes, is power’ (2016: 2). They also point to the transience of the book as a definable entity: ‘it exists in so many different guises, and is always finding new ways to reinvent itself’ (2016: 2). This essay does not attempt to provide a conclusive definition of what makes a book and, as such, is in the difficult position of having to assess a set of publications on their affinities to an elusive concept. Despite this, the notion of the academic book, while volatile, is at least recognizable, in that we all have a sense, however subjective, of what constitutes good scholarship. If scholarship is what we are looking for in the content of academic books, then we should not allow ourselves to be distracted by forms which enrich, without necessarily defining, such content.

## Exemplars

### *I ♥ E-Poetry*

<http://iloveepoetry.com/>

*I ♥ E-Poetry* was founded by Leonardo Flores, who launched the project as a means of building a knowledge base of short-form scholarship on digital poetry and poetics. The initial concept was to write 100 words daily on a piece of born-digital literature. The project has since grown to the point where it now includes longer entries and has a number of contributors. This encyclopedic

resource contains approximately 700 posts, totaling some 210,000 words - more than enough content to satisfy established conventions of what constitutes a monograph. The format of the resource as a scholarly blog updated each day precludes substantial editorial interventions or peer review; however, in instances where graduate students or junior faculty propose entries, these are refereed. While the entries are short form, they are critical and interpretive, offering new meaning on a consistent theme, the hallmark trait of an academic book.

The academic value of this resource comes from the speed with which it can publish new entries, all written in a casual style so as to make the resource an accessible, informative guide to electronic literature:

The speed necessary for daily publication was only possible within the genre and conventions of the blog. As its readership within the electronic literature community grew, it became clearer that this was a constraint driven critical writing performance. Some conversations with the community led to adapting and broadening its focus, from strictly reading poetry to including other works of e-literature and Internet culture from a poetic perspective. (Flores, 2017)

*Speed* is important in a domain where the critical focus is on an experimental literary movement which continues to garner broader academic and popular attention. The Arts and Humanities continue to increasingly shift toward subject matters unsuited to the old model of publication, wherein the turnaround time between submission and publication is often several years. Furthermore, there has never been a greater need for Arts and Humanities scholarship to have an impact beyond the Academy, and the quicker scholars can share their insights with public audiences, the better. *I ♥ E-Poetry* receives upward of 5000 views from 2000 unique visitors each month, recording some 200,000 unique visits since it was launched. Beyond the popular appeal of the resource, it is extensively cited in critical writing and used in pedagogical contexts – its scholarly value is demonstrated in its appeal to both general and specialist audiences.

## Pathfinders

<http://scalar.usc.edu/works/pathfinders>

Produced by Dene Grigar and Stuart Moulthrop, *Pathfinders* looks to document the experience of first-generation electronic literature by recording interactions with the authors of such works as well as traversals by readers interacting with relevant pieces. Funded through an NEH Digital Humanities Startup grant (NEH HD-51768-13), *Pathfinders* worked with five authors of early digital fiction, asking them to demonstrate their works on camera, using equipment closely approximating the platform for which the work was originally designed; authors also gave interviews and, in some cases, a public talk. In 2013 and 2014, Grigar, Moulthrop, and their students compiled and edited the results of the *Pathfinders* sessions into a Scalar e-book. The e-book offers a framework for the segmented video presentations as well as curatorial information on the four digital fictions ultimately presented.

The *Pathfinders* e-book went live on June 1, 2015 and has been used extensively by teachers, researchers, and students, fulfilling the project's aim to maintain access to key works of electronic literature that have been threatened with obsolescence. To date, it has seen 18,593 visits from 273 universities, centers, libraries, and schools located in 58 countries. In addition to the audiovisual materials that the project's Scalar edition makes available, Grigar and Moulthrop have a print book, *Traversals* (2017b), that offers close readings of these works. In this sense, *Pathfinders* might be described as a methodology and *Traversals* the product of that methodology:

In essence, what the project produced is a methodology (pathfinders) and a process (traversal) for documenting multimedia, interactive born digital works that expands beyond electronic literature to video games, virtual worlds, media art, and other forms. (Moulthrop and Grigar, 2017a)

*Pathfinders* and *Traversals* are distinct projects, but both are legitimately academic - the latter could have been written without the former:

The books address different audiences and purposes: *Pathfinders* primarily aims to compile a literary-historical record, through that record to maintain the availability of key contributions, and by investigating a novel approach, to enhance the work of preservation. *Traversals* is a more traditional work of bibliographic criticism and literary history, written for a specialist scholarly audience. *Pathfinders* is meant to be a teaching resource as well as an archival project, and so may have greater reach or social impact. (Moulthrop and Grigar, 2017a)

*Pathfinders* suggests that thorough research of electronic writing - specifically, research involving digital textual analysis of multimedia, interactive born-digital texts - requires access not only to library collections but also to rogue archives (De Kosnik, 2016), where electronic literary works can be experienced on computers they were originally published and intended to be viewed. This project is an interesting example of how edge cases interact with more traditional forms, being both resource and insight at once. *Pathfinders* is an example of how many academic books are now digital out of necessity, a consequence of authors having to account for new types of materials and novel methodologies that cannot be similarly accommodated by print.

## *Radio Nospace*

<http://radionospace.net/>

Produced by John Barber, *Radio Nospace* is a repository for research, scholarship, and creative practices regarding radio and sound. It was established in 1997 as part of Nospace Gallery & Media Lounge, a virtual environment experimenting with online, participatory communities. *Radio Nospace*, as Radio Nospace Internet Café, with the tagline ‘the sounds of intelligent cyberspace’, provided online teaching and learning opportunities. The ‘Wednesday Café’ program was popular for its broadcasts of local poetry readings over the Web to international audience (Grigar and Barber, 2009). Different media draw attention in different ways, and *Radio Nospace* is an example of a discursive process that recognizes the potential of audio materials to engage with an audience:

*Radio Nospace* is inspired by the radio medium and its multilayered cultures, each with an emphasis on sound(s) consciously curated and broadcast as related knowledge modalities (i.e. programs) for the purpose of interpreting and distributing information to a broad public. Radio is based primarily on the sound of the human voice. With no opportunity to see the speaker, we are forced to listen. (Barber, 2017)

This notion of layering is essential to scholarship that is published in born-digital contexts: media can be overlaid, materials augmented, information nodes can be interconnected, and distributed content curated.

The academic book has traditionally privileged text, but the digital age has liberated other media, allowing more visual and aural modes to take precedence in relevant contexts. *Radio Nospace* is an interesting edge case in that it demonstrates two things: it shows how text can be

subverted through digital publishing, and it represents the distinction between ‘a blog’ or Web-based portfolio and a consistent collection of valuable scholarship that replicates what we consider a monograph. It is a collection of materials on a consistent theme, containing all of the information and representing the scholarly rigor that one would expect of an academic book. The digital holds the potential to reconstruct the book as laboratory, wherein initiatives like *Radio Nospace* provide a space for scholars, in individual and collective capacities, to undertake practice-based research and creative meaning-making.

### *Infinite Ulysses*

<http://www.infiniteulysses.com/>

*Infinite Ulysses* supports social annotation of James Joyce’s challenging novel, *Ulysses*, allowing any reader to highlight words and phrases in the novel and add questions, interpretations, reactions, translations, definitions, and other comments to the highlighted text. The goal is to explore the design of digital edition interfaces toward meaningful public participation in the literary conversation around a complex text. The site also tries to let each reader personalize the annotations they see, so as to display those that match their interests and needs. The project was Amanda Visconti’s doctoral dissertation at the University of Maryland (Visconti, 2015, 2017), motivated by its creator’s interest in textual scholarship as an open and inclusive practice:

I decided that instead of focusing on the scholarly editing aspect of digital editions, my skills and interest were more in line with work like that of Alan Galey, whose Visualizing Variation project created code that lets editors of digital editions intervene in their texts in unique ways. Rather than creating a scholarly edition, I focused more on interface design aimed at opening a literary edition to a public audience. (Visconti, 2017)

*Infinite Ulysses* went on to receive its institution’s Distinguished Dissertation Prize (University of Maryland, 2016), a promising sign that universities are starting to give equal recognition to work that goes beyond the proto-monograph.

Interestingly, Visconti herself does not consider the project to be an academic book and points instead to projects like the Web-based drafts for Fitzpatrick’s *Planned Obsolescence* (2009) ‘that uses some of the affordances of the print codex’ like a table of contents, chapters, and paragraphs for structure (Visconti, 2017). She also references Sample (2013) in her definition of scholarship:

For me, scholarship is thinking hard and sharing that thinking so that others can learn from and build on it. The academic book and peer-reviewed journal article are two of many possible methods for and forms of scholarship. With humanities scholarship, the research method of *writing*, often results in the research communication of *writing*. With DH, method and communication may be disjoint: I might learn through design and code, and then share this knowledge by writing or through a performance like *InfiniteUlysses.com*. (2017)

Visconti’s position highlights how the scholarly record is increasingly comprised of contributions designed to enable others to create meaning. This is not to say that previous forms of print-based scholarship do not provide strong foundations for knowledge iteration but, rather, that the intention is different – in an edge case like *Infinite Ulysses*, the emphasis of the principal investigator is on *enabling* others, rather than disseminating their own position.

As a crowdsourced annotated edition, *Infinite Ulysses* shows how edge cases might include ‘community books’, projects wherein new knowledge and meaning are created but through the

annotations of the crowd. What is interesting about *Infinite Ulysses* is that much of the project's value is crowdsourced. This is unlike various scholarly collections that have included commenting and annotation features alongside the new scholarship they present; *Infinite Ulysses* is taking old material and giving it renewed significance through open collation – it is scholarship as interface.

### *Poetics of the Archive*

<http://bloodaxe.ncl.ac.uk/>

Funded by the Arts and Humanities Research Council, the *Poetics of the Archive* project followed the accession by Newcastle University of the Bloodaxe Books archive in 2013. Led by Linda Anderson, the project was designed as a creative and community engagement project, introducing poets, artists, readers, and community groups to Bloodaxe archival materials and fostering innovative and creative responses to the archive. As part of the project, a website with a generous interface (Whitelaw, 2015) was designed, featuring digitized archival materials, short films, photographs, author interviews, new poems, innovative search functions, and short critical writings. *Poetics of the Archive* is participatory in the sense that it encourages responses to the archive – including films, artworks, and author interviews. Furthermore, the website itself is designed as an innovative medium for engagement with archival materials, providing a space for open and interactive digital encounters with typescripts, page proofs, and other archival matter. Its researchers view it as a 'living archive', subject to 'continued accumulation and provoking ongoing critical and creative responses' (Byers, 2017).

The project is a further example of how the digital is attracting scholars who wish to extend the creative potential of their outputs so as to match the critical aspects:

Output from the project has taken a number of forms, both creative and critical. In addition to the website itself, new poems, artwork and short films were produced in direct response to the Bloodaxe archive. Short critical writings on poems and items in the archive have also been incorporated into a dedicated 'Research' section of the website. (Byers, 2017)

Archival practices are often mischaracterized as acts of remediation rather than an inherent part of the critical ecology. Archives are - more than instruments, and they are scholarly outputs in themselves, born of expertise and interpretation. They operate as scholarly editions, making available materials which would otherwise have remained concealed. They can also facilitate public expression:

*Poetics of the Archive* was guided by a conception of the 'living archive', the archive as ongoing accumulation, a point of documentary transformation, and a space for critical, creative and affective engagements. This idea extended to the website itself, which seeks to go beyond simple information-retrieval and instead encourage more open-ended, subjective and serendipitous engagement with the archival material presented. (Byers, 2017)

This expression is archived in turn, producing, as in many of these edge cases, a more organic and diverse form of scholarly discourse.

### *Christianity and Culture*

<http://www.christianityandculture.org.uk/>

The Centre for the Study of Christianity and Culture at the University of York undertakes research projects which make use of digital modeling to create visual representations of

significant sites. One such project has seen virtual reconstruction of St Wilfrid's seventh-century Hexham Abbey (The Centre for the Study of Christianity and Culture, n.d.) so as to present the structure's 'rich and largely hidden history to visitors in a way which was engaging, thought-provoking and fun' (Gibbs, 2017). The Abbey is 'a fascinating amalgam of the many phases of its long history' (Gibbs, 2017), largely because it still retains its Anglo-Saxon crypt, constructed from reused Roman stone:

We were commissioned to create a digital model of the abbey's development through time, from Wilfrid's church to the present day, and to incorporate the archaeological and historical evidence in ways which would encourage people to explore and question for themselves. The result is a touch-screen based interface composed of model phases and layered information which can be explored as visitors' interest dictates, but which allows people to see some of the exhibition objects on display in their historical context and to understand more about the evolution of the building and the role in the history of the area. (Gibbs, 2017)

Computer-generated three-dimensional models provide a means through which scholarship can be embedded in a form that is spatially aware, representing an opportunity to move beyond place as fact to space as meaning, giving readers a true sense of a location where certain places or contexts might now be lost to them.

This project is a useful example of the intellectual investment that is required to develop resources of this nature:

Although tantalisingly described in some respects in contemporary or early sources, there was little hard evidence to go on and some extremely ambiguous archaeological data to interpret. We were fortunate to have the advice and input of Professor Richard Bailey and Professor Eric Cambridge whose expertise was brought to bear on the tentative reconstructions we based on continental comparanda and the limited evidence available. The result is something which stands up to academic scrutiny, but which also adds something meaningful to the debate. The process of creating a 3D digital model is an unforgiving one and details which can be elegantly elided in a written piece are brought into sharp focus when trying to rebuild something. The 'many coloured columns' or 'twisting staircases' – where were they, how many, how tall, staircases to where? – and so on. (Gibbs, 2017)

If we consider the academic book as the outcome of a prolonged and intensive process of discovery and interpretation, then the computer-assisted work of such initiatives should be considered the equivalent of any such product.

## **Conclusions**

Elucidating on the academic book of the future entails predicting what forms might soon be considered to be the equivalent of rather than a replacement for the codex – the book, as we have known it for centuries, is far from dead. If anything, it is thriving, and considering its demonstrated capacity for perseverance, coupled with an alignment with the tenets of the Arts and Humanities, such a trend should be construed as positive. However, as we continue to synthesize scholarly practices with the affordances of contemporary modes of expression and dissemination, there is a need to accept the inevitability of the book's rhizomic future. The codex will persist, not only in print, but in the shape of the e-book, which largely mimics the structures and qualities of its predecessor. What will change is the centrality of the codex, which will in time have to concede its dominance of the academy to a multiplicity of scholarly arrangements. As demonstrated by some

of the projects in this essay, this is already happening, and so it is vital that we now begin to demand that colleagues and institutions begin to recognize the value of this work. Despite the prevailing discourse that has emerged from fields like the Digital Humanities, this type of scholarship is not yet recognized as equivalent to more established forms, such as the print monograph. The sad reality is that senior faculty who tell students and junior colleagues otherwise are doing their protégés a disservice, as ‘traditional’ publications – again, be they print or digital – are still the best way to enhance one’s employability and prospects.

The suggestion here is not that all digital outputs are equivalent in scholarly value to their antecedents – the significance of many digital projects can be questioned, just as one might challenge the importance of any other form of scholarship. This brief essay simply outlines a few of the many examples where scholars and practitioners have availed of the affordances of computation in order to create academic resources that might be considered equivalent to more established forms – the content of initiatives like *Radio Nospace* and *I ♥ E-Poetry* would easily fill the page space of a standard-length monograph, but such content is unsuited to the page, and so it has had to be articulated through the screen. These projects are not scholarly because they are representative of trends that happen to be en vogue, but because they demonstrate the intellectual, curatorial, and communicative rigor that should be expected of any academic undertaking. The privilege of print is that we assume its content possesses such rigor by default, when the reality is that there are many examples of careless writing and trivial research being legitimized by questionable publications and reviewing processes. The role of Arts and Humanities scholars is to create and share knowledge and meaning that is of value to their students, communities, and, indeed, the general populace - the tools which scholars use to generate, frame, and disseminate their work should not distract from the quality of that which is being shared. The examples outlined in this essay are compelling examples of how edge cases, while mimicking the academic book to differing degrees, are equivalent in terms of the scholarship entailed.

A number of commonalities emerged while interacting with the project stakeholders. Particularly, there was a very strong emphasis on public engagement and how the appeal of the digital appeals is in its disseminative potential. There is a marked desire to produce outputs that might act as foundations upon which others can directly build, and digital forms are seen as the best way to realize that objective. There are distinct ideological consistencies among these scholars which align with those of the open movement. But form is not always political and, sometimes, print just will not do. It is clear in each of these cases that computation was absolutely required to satisfy the needs of their investigators and that their use of digital apparatuses was born more out of necessity than a desire for a wider audience. Herein lies one of the major distinctions between edge cases and digital projects which mimic the codex: they have no alternative to operating on the screen and are born digital because they could not exist any other way. The ability to iterate quickly, to create ongoing and open-ended resources, is highly attractive to those scholars surveyed in this essay. There is also a distinct creative element, wherein scholars are looking to augment the critical components of their work through multimodality. *Poetics of the Archive*, for example, foregrounds non-textual responses to archival material.

The changing face of the scholarly book is symptomatic of broader cultural shifts within the academy: scholars are no longer siloed masters of the esoteric tasked with lecturing and writing, they are, among a great many other things, archivists, developers, designers, and cultural commentators - public servants in the truest sense. Edge cases also have repercussions for the ways in which we assess scholarship. Many of this essay’s respondents outlined how the materials they are disseminating are continually vetted and peer-reviewed by users, who often provide additional

information and feedback, requiring expert stakeholders to perform as editors as well as contributors. It is beyond the scope of this essay to discuss the benefits and failings of peer-review models, but it is worth noting that we need to continue to address the issue of assessment as new forms of scholarship continue to emerge.

Exploring the academic book of the future is not just about evaluating and anticipating the new forms that scholarship might take, it is about considering the value systems that we adhere to as critics and educators. That we still have to compare the scholarly equivalence of edge cases with that of their print-based counterparts is evidence that the Arts and Humanities are not embracing the culture of transformation that these fields pretend to embody. By the same token, we should not abandon established forms which still have much to offer a world that is increasingly dominated by ephemera circulated throughout an ecosystem controlled by a small few profit-driven organizations. Scholarship is about creating and enabling, and both print and digital can serve these acts. Our value systems need to adapt to the multiplicities of expression that continue to emerge, not for the purposes of replacing 'the old' but so that all academic activities might be weighed within frameworks constructed of consistent parameters. The reality is that the authors, creators, and producers of edge cases might have been better placed exerting their efforts in the writing of books. In essence, we need to reconsider what it means to be bookish, so that we might reconsider the currencies of our field.

### **Author's note**

A draft of this article was previously published as a report as part of the AHRC-funded Academic Book of the Future project (O'Sullivan, 2017). For a list of all reports and resources generated by the project, see: <https://academicbookfuture.org/links-and-resources/>.

### **Acknowledgments**

The author would like to thank the following individuals for their direct contributions: Leonardo Flores, John Barber, Dene Grigar, Stuart Moulthrop, Amanda Visconti, Patrick Gibbs, and Mark Byers, as well as colleagues at Sheffield's Digital Humanities Institute, most notably, Michael Pidd.

### **Note**

1. The selection of projects is by no means exhaustive in terms of structural, technical, or cultural representation. All of the projects discussed are exemplars of what might be considered an edge case and form a useful sample that, while not nearly extensive, is suitably illustrative for the scope of this essay.
