### Reaction mechanism

The formation of NiF<sub>2</sub>@Ni NAs in a 1:50 mL (v/v) HF solution in ethanol occurs as follows under hydrothermal conditions. When ethanolic HF solution is hydrothermally heated it produces ethoxy and fluoride ion radicals and protons. At the same time, Ni foam in the

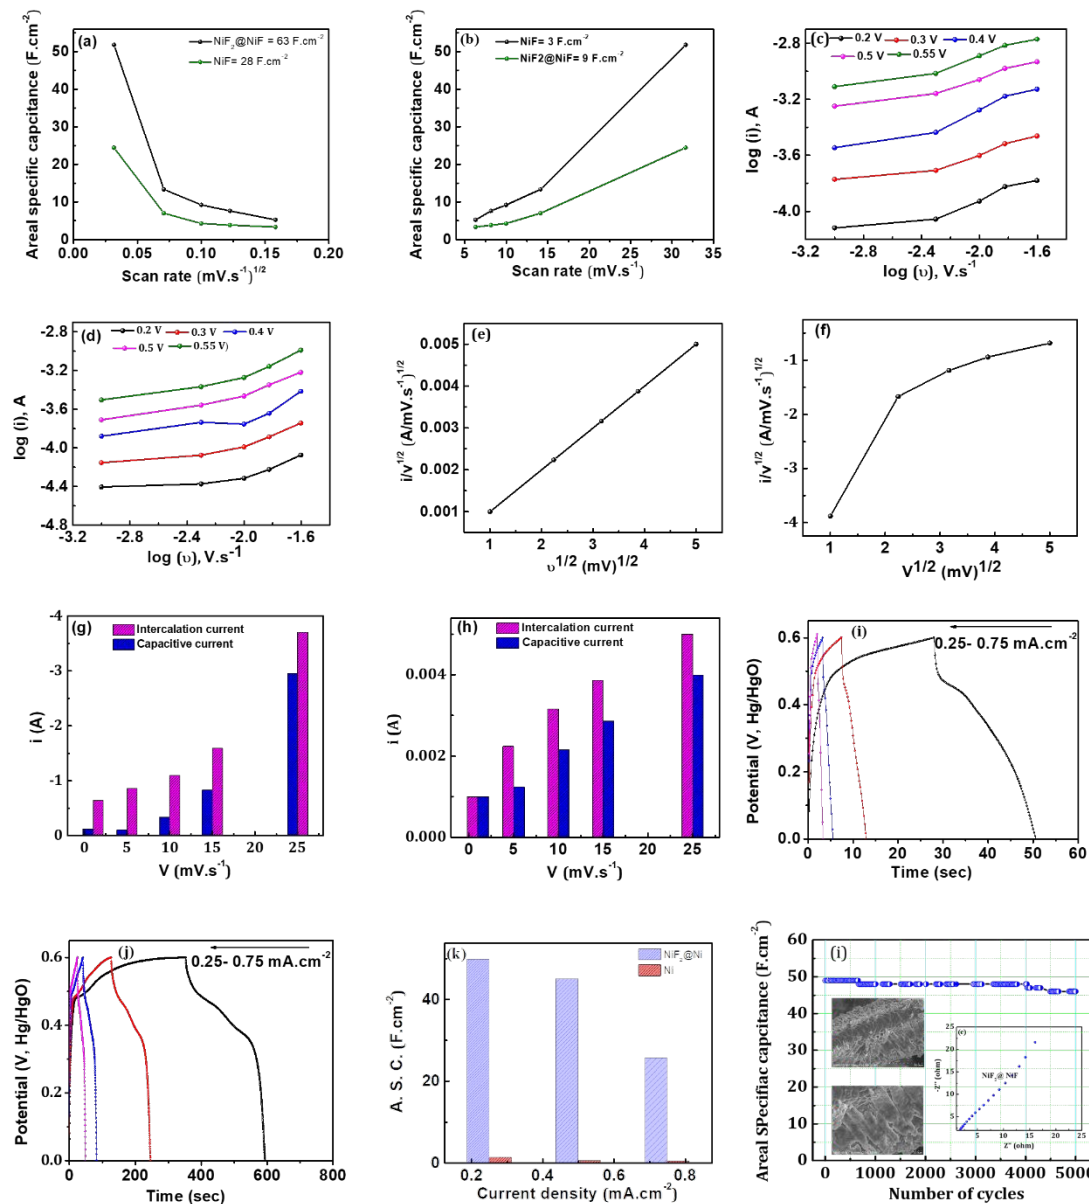

solution oxidizes to provide nickel ions and electrons in to solution reduce fluoride ions to nucleate on the Ni foam surface as shown in Scheme S1. In this reaction, hydrothermal displacement occurs between Ni and F, causing deposition of NiF<sub>2</sub>@Ni.

**Figure S1.** Schematic image illustrating the possible formation mechanism of the NiF<sub>2</sub>@Ni during hydrothermal method. The black 3D network represents the Ni-foam surface, blue and yellow spheres are Ni<sup>2+</sup> and F<sup>-</sup> ions and on the right hand side we show a schematic sketch of the nanorod array (NA) of NiF<sub>2</sub>.

**Figure S2.** (a and b) BET (inset shows pore size distribution) and CV curves of NiF, and (c) CV curves of NiF<sub>2</sub>@NiF at different scan rates in the range 5-25 mV s<sup>-1</sup>.

**Figure S3.** Trasatti plots: (a and b) areal capacitance vs.  $1/(mv)^{1/2}$  and areal capacitance vs.  $1/(mV)^{1/2}$  for  $NiF_2@NiF$  and  $Ni$ . (c and d)  $\log I$  vs.  $\log v$  plots for the  $NiF_2@Ni$  and  $NiF$  used for estimating slope 'b'. (e and f)  $i/v^{1/2}$  vs.  $v^{1/2}$  plot to determine  $a_1$  and  $a_2$  (@ 0.2 V), with (g and h) showing the share of the capacitive and battery contribution for the  $NiF_2@Ni$  and  $Ni$ . (i and j) GCD curves and (k) ASC of the  $NiF_2@Ni$  and  $Ni$  at different current densities. (l) Stability of the  $NiF_2@Ni$  NA over 5000 cycles (inset shows FE-SEM image and EIS graph 5000 cycles  $NiF_2@Ni$  electrode after 5000<sup>th</sup> cycle).

### Device fabrication process

The  $\text{NiF}_2@/\text{Ni}$  device fabricated using  $\text{NiF}_2@/\text{Ni}$  electrodes (a) and separated by a sheet of separator was mounted in a plastic cell (b) (see digital photograph in Figure S3 c) with 1 M KOH of electrolyte solution. Two wires from both electrodes were carefully drawn before sealing the pencil plastic cell for electrical processing.

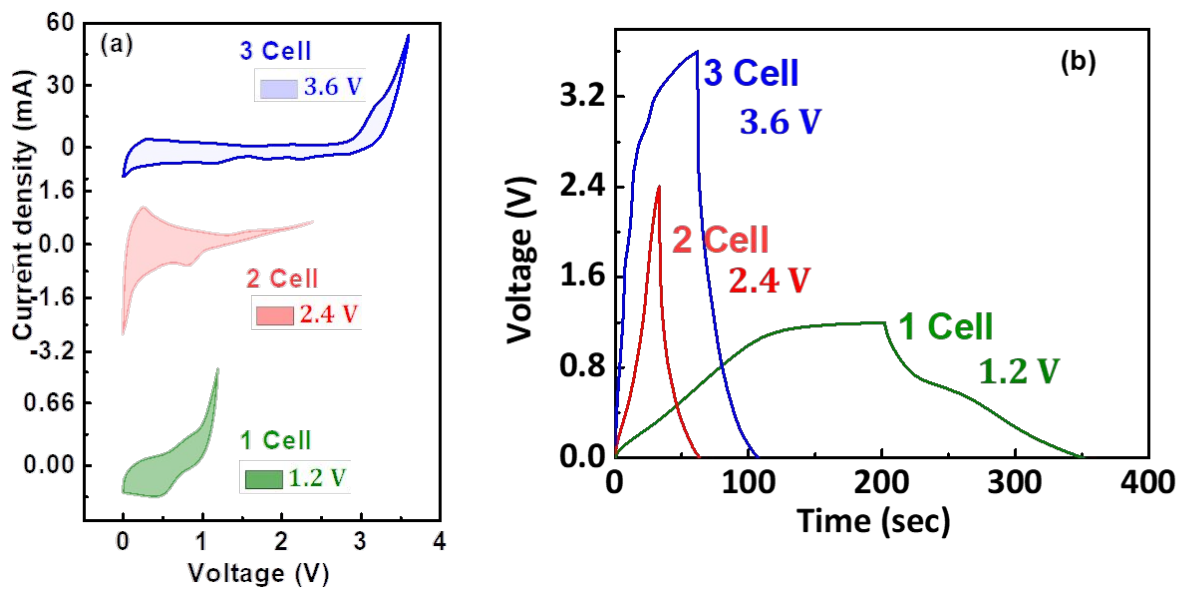

**Figure S4.** (a) Photoimage of the  $\text{NiF}_2@/\text{Ni}$  form used in the supercapattery device. (b) the outer plastic casing used to house the supercapattery. (c). The final assembled device with connection leads. (Photograph courtesy of 'Nanasaheb M Shinde).

**Figure S5.** Stability of the NiF<sub>2</sub>@Ni//NiF<sub>2</sub>@Ni symmetric ESS device for 5000 redox cycles. The cell maintains ~11 F g<sup>-1</sup> from an initial specific capacitance of 15 F g<sup>-1</sup>.

**Figure S6.** (a and b) CV and GCD curves of series combination of  $\text{NiF}_2@Ni//\text{NiF}_2@Ni$  symmetric electrochemical device.
